The invention relates to in vitro identification (MI) of genes expressed in the skin of humans or animals by subjecting a mixture of genetically encoded factors from skin, to serial analysis of gene expression (SAGE) so as to identify skin-expressed genes and quantify their expression.

(MI) is useful for identifying genes involved in skin homeostasis; to promotes skin homeostasis and to test agent (A) that maintains or promotes skin homeostasis or that can be used for treating skin disorders, specifically neurodermatitis; sunburn; psoriasis; scleroderma; ichthyosis; atopic dermatitis; acne; seborrhea; lupus erythematosus; ichthyosis; melanoma; basal cell carcinoma; and carcinoma or sarcoma of the skin. The present sequence is that of a human expressed sequence tag (EST) of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                              In vitro identification of skin-expressed genes, useful for determining homeostasis and identifying cosmetic or pharmaceutical agents against

The invention relates to in vitro identification (M1) of genes expressed in the skin of humans or animals by subjecting a mixture of genetically encoded factors from skin, to serial analysis of gene expression (SAGE) so as to identify skin-expressed genes and quantify their expression (M1) is useful for identifying genes involved in skin homeostasis; to promotes skin homeostasis and to test agent (A) that maintains or promotes skin homeostasis or that can be used for treating skin disorders, specifically neurodermatitis; sunburn, psoriasis; scleroderma; ichthyosis; atopic dermatitis; acne; seborrhea; lupus erythematosus; rospaca, melanoma; basal cell carcinoma; and carcinoma or sarcoma of the skin. The present sequence is that of a human expressed sequence tag (EST) of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Human; skin; dermatological; vulnerary; antipsoriatic; antiseborrhaeic;

This invention describes a novel in vitro method for identifying genes that are significant for hair-bearing skin in humans. The method comprises recovering, from hair-bearing skin, a first mixture of genetically expressed (transcribed and optionally translated) factors (i.e. proteins, mRNA or their fragments), recovering a second, similar mixture from skin on which hair does not grow and subjecting both mixtures to serial analysis of gene expression (SAGE) to identify those genes for which expression is markedly different between the two types of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    In vitro identification of genes important for hair-bearing skin, useful for assessing homeostasis and in screening for pharmaceutical or cosmetic agents, based on differential expression analysis.
                                                                repeat within a coding sequence (expressed sequence tag, EST), which comprises detecting tandem repeats in a target coding sequence, scoring the repeats for polymorphic probability and generating a dareaset correlating the repeats with polymorphic probability to identify a candidate polymorphic repeat. The computational methods (polymorphic marker prediction of ubiquitous simple sequences, POMPOUS, and Rep-X) are useful for identifying and detecting candidate polymorphic repeats in human genes, which can be used to understand, treat or eliminate genetic diseases, predispositions or adverse drug-treatment reactions. Examples of diseases linked to nucleotide repeats are Machado-Joseph, Haw River
                                                The invention discloses a method for identifying a candidate polymorphic
                                                                                                                                                                                                                                                                                                                 syndrome, Huntington's disease, fragile-X syndrome, Fredreich's ataxis, myotonic dystrophy, hyperandrogenaemia, spinal and bulbar atrophy and spinocerebellar ataxis. The sequences presented in ABX79676-ABX80022 are the polymorphic repeats identified for a search of human ESTS
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     hair-bearing skin; human; serial analysis of gene expression; SAGE;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        8
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               ö
                                                                                                                                                                                                                                                        The invention relates to in vitro identification (M1) of genes expressed in the skin of humans or animals by subjecting a mixture of genetically encoded factors from skin, to serial analysis of gene expression (SAGE) so as to identify skin-expressed genes and quantify their expression. (M1) is useful for identifying genes involved in skin homeostasis; to determine skin homeostasis and to test agent (A) that maintains or promotes skin homeostasis or that can be used for treating skin disorders, specifically neurodermatitis; subburn; psoriasis;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                ichthyosis, atopic dermatitis, acne, seborrhea, lupus erythematosus, rosacea, melanoma, basal cell carcinoma, and carcinoma or sarcoma of the skin. The present sequence is that of a human expressed sequence tag
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 for

skin. The invention also describes in vitro methods for determining homeostasis of human hair-bearing skin and for determining activity of discurbances of the maceutical agents for use against disorders or disturbances of the homeostasis of human hair-bearing skin. A biochip and a test kit comprising a solid support (flexible or rigid) with mimmobilised probes are also described for determining homeostasis. The hair-bearing skin is from the scalp and the other skin is from the face. The method allows identification of as many as possible of the genes important for hair-bearing skin, and therefore, of a very wide range of potential therapeutic and cosmetic agents. In vitro identification of genes important for hair-bearing skin, useful for assessing homeostasis and in screening for pharmaceutical or cosmetic agents, based on differential expression analysis. Claim 7; SEQ ID NO 68; 250pp; German.

This invention describes a novel in vitro method for identifying genes that are significant for hair-bearing skin, a first mixture of genetically expressed (transcribed and optionally translated) factors (i.e. proteins, mRNA or their fragments), recovering a second, similar mixture from skin on which hair does not grow and subjecting both mixture to serial analysis of gene expression (SAGE) to identify those genes for which expression is markedly different between the two types of skin. The invention also describes in vitro methods for determining homeostasis of human hair-bearing skin and for determining activity of cosmetic and pharmaceutical agents for use against disorders or disturbances of the homeostasis of human hair-bearing skin. In vitro identification of genes important for hair-bearing skin, useful for assessing homeostasis and in screening for pharmaceutical or cosmetic agents, based on differential expression analysis.

Claim 4; SEQ ID NO 1325; 250pp; German.

This invention describes a novel in vitro method for identifying genes that are significant for hair-bearing skin in humans. The method comprises recovering from hair-bearing skin a first mixture of genetically expressed (transcribed and optionally translated) factors (i.e. proteins, mRNA or their fragments), recovering a second, similar mixtures from skin on which hair does not grow and subjecting both mixtures to serial analysis of gene expression (SAGB) to identify those mixtures to serial analysis of gene expression (SAGB) to identify those of skin. The invention also describes in vitro methods for determining commetic and pharmaceutical agents for use against disorders of commetic and pharmaceutical agents for use against disorders of disturbances of the homeostasis of human hair-bearing skin. A biochip and a test kit comprising a solid support (flaxible or rigid) with a test kit comprising a solid support (flaxible or rigid) with commetted probes are also described for determining homeostasis. The immobilised probes are also described for determining homeostasis. The immobilised allows identification of as many as possible of the genes compensate the parange of important for hair-bearing skin, and therefore of a very wide range of mportant for hair-bearing skin, and therefore of a very wide range of potential therapeutic and cosmetic agents. This invention describes a novel in vitro method for identifying genes
that are significant for hair-bearing skin in humans. The method
comprises recovering, from hair-bearing skin, a first mixture of
genetically expressed (transcribed and optionally translated) factors
(i.e. proteins, mRNA or their fragments), recovering a second, similar
mixtures from skin on which hair does not grow and subjecting both
mixtures to serial analysis of gene expression (SAGS) to identify those
genes for which expression is markedly different between the two types of
skin. The invention also describes in vitro methods for determining
cosmetic and pharmaceutical agents for use against disorders or
disturbances of the homeostasis of human hair-bearing skin. A biochip and
catest kit comprising a solid support (flaxible or rigid) with
immobilised probes are also described for determining homeostasis. The
hair-bearing skin is from the scalp and the other skin is from the face.
The method allows identification of as many as possible of the genes
important for hair-bearing skin, and therefore, of a very wide range of
coccential therapeutic and cosmetic agents. This sequence represents a
mind of the companies of the conserved of a very wide range of
the method allows and the companies. The sequence represents a
many and the companies of the planes associated with hair-

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                This invention describes a novel in vitro method for identifying genes that are significant for facial skin in humans. The method comprises recovering, from facial skin, a first mixture of genetically expressed (transcribed and optionally translated) factors (i.e. proteins, mRNA or their fragments), recovering a second, similar mixture from some other human tissue, preferably skin from a protected area, especially from the breast and subjecting those genes for which expression is markedly different between facial skin and the other tissue. The invention also describes an in vitro method for determining homeostasis of human facial skin; a test kit which comprises a solid support (flexible or rigid) on which are immobilised probes that bind specifically to the factors of interest and a biochip for determining homeostasis of human facial skin. The products of the invention are also used in a method which determines activity of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           cosmetic and pharmaceutical agents for use against disorders or disturbances of the homeostasis of human skin and a screening method for identifying cosmetic and pharmaceutical agents. The method allows identification of as many as possible of the genes important for facial skin and thus of a very wide range of potential therapeutic and cosmetic agents. ADQ31911-ADQ35111 represent human DNA Tag fragments used to identify the facial skin-associated genes described in the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    In vitro identification of genes important for facial skin, useful for assessing homeostasis and in screening for pharmaceutical or cosmetic agents, based on differential expression analysis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Gaps

This invention describes a novel in vitro method for identifying genes that are significant for facial skin in humans. The method comprises that are significant for facial skin in humans. The method comprises recovering, from facial skin, a first mixture of genetically expressed (transcribed and optionally translated) factors (1.e. proteins, mRNA or their fragments), recovering a second, similar mixture from some other human tissue, preferably skin from a protected area, especially from the brewen facial skin and the other tissue. The invention also describes an in vitro method for determining homeostasis of human facial skin; a test kit which comprises a solid support (flexible or rigid) on which are immobilised probes that bind specifically to the factors of interest and a biochip for determining homeostasis of human facial skin; a test immobilised probes that bind support (flexible or rigid) on which are a slow used in a method which determines activity of cosmetic and pharmaceutical agents for use against disorders or disturbances of the homeostasis of human skin and a screening method for identification of as many as possible of the genes important for facial skin and thus of a very wide range of potential therapeutic and commetic agents. Adapting the sense is a suppossible or the genes important for facial skin and thus of a very wide range of potential therapeutic and commetic agents. dentify the facial skin-associated genes described in the invention

The present sequence represents a potential triple-helix forming region. It can be used to demonstrate the assay of the invention. The assay comprises adding a sample containing double-stranded DNA test sequences, e.g. containing the present sequence, to an aqueous medium containing at least one complex of anchor DNA, attached to a solid support, and reporter DNA, where either a part of the anchor DNA or reporter DNA is designed to form a triple-strand structure with part of the test sequence. Triplex formation results in displacement of the reporter DNA, which is detected as an indication of the presence of the DNA test sequence. The method is used to detect DNA sequences, particularly for identification of bacteria (DN detecting genes for ribosomal RNA) in clinical samples, but also detection of oncogenes and Hepatitis B virus Assay of genetic sequences based on triplex formation from double stranded analyte - and hybrid of anchor and reporter sequences, with reporter released if triplex formation occurs, used e.g. to identify Gaps ö Metastatic breast tumour cell upregulated transcript tag #1214. ```
that are preferentially transcribed in the metastatic breast tumour tissue (i.e. are upregulated in metastatic breast tumour cells). AAZ83942

to AAZ8667 represent tags corresponding to distinct transcribes that are preferentially transcribed in the primary or non-metastatic breast tumour tissue (i.e. are downregulated in the primary or non-metastatic breast tumour tissue (i.e. are downregulated in metastatic breast tumour cells). These transcripts can be used for diagnosis, monitoring and treatment of breast cancer, particularly where metastatic. Diagnosis is by standard immunoassays or hybridiastion/amplification reactions.

Compounds that modulate expression of the transcripts are potentially useful for treatment of (metastatic) breast cancer, while promoters from the transcripts are used to direct expression, in selected cell types, of e.g. therapeutic genes (also ribozymes or antisense sequences).

To articularly an antigen-encoding sequence for use in gene or cell-based vaccines; for diagnosing breast cancer and for raising specific antibodies (Ab). Ab are used to detect the polypeptides or as therapeutic agents. Host cells that produce the polypeptides can be used to expand and isolate populations of educated, antigen-egecific immune effecter cells.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            to AAZ83941 represent tags corresponding to distinct transcripts

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 S
                                                                                                                                                                                                                                                                                                                                                                                                                                                              The present invention is concerned with a method of differential display of prokaryotic mRNA by RT-PCR. This involves the amplification of the mRNA once, and the further amplification of the cDNA, rather than the repeated amplification of the mRNA sample. It also eliminates the need for sequencing gels, using Northern and total RNA dot blots to confirm differentially displayed transcript levels. The primers AAA99849-A99866 were used in a reverse transcription PCR amplification, and primers AAA99866-A99876 were used to prepare probes for a Northern blot analysis. The method can be used to prepare probes for a Northern blot analysis. The method can be used to rapidly identify genes with increased or fermentations, and to analyse gene regulation. (Updated on 06-AUG-2003 to correct OS field.)

The present sequence is a primer useful for detecting human interleukin-
CC 15 (IL-15) gene polymorphism by primer extension methods. IL-15 gene is
C located on chromosome 4931. The polymorphic variants of IL-15 genes are
CC useful for studying the expression and function of IL-15 and expressing
CC IL-15 protein for use in useful for screening for candidate drugs to
CL-15 protein for use in useful for screening for candidate drugs to
CC individual at the novel IL-15 polymorphic sites are useful for studying
CC individual at the novel IL-15 polymorphic sites are useful for studying
CC individual at the novel IL-15 polymorphic sites are useful for studying
CC oppulation and incape of the phenotypic level, paternity testing,
CC diversity and lineage of the phenotypic level, paternity testing,
CC diversity and a trait such as level of drug response or
CC susceptibility to disease. Identifying an association between a genotype
CC crangentic treatments for infections, human immunodeficiency virus and
CC call leukaemia. The identification of an association between a clinical
CC response and a genotype or haplotype (or haplotype pair) for the IL-15
CC gene may be the basis for designing a diagnostic method to determine
CC alternatively, will respond at a lower level and thus may require more
CC treatment, i.e. a greater dose of a drug. The genotyping or haplotyping
CC alternatively, will respond at a lower level and thus may require more
CC treatment, i.e. a greater dose of a drug. The genotyping or haplotyping
CC genotyping and haplotyping methods are also useful in designing clinical
CC crials. IL-15 NNA is useful for therapeutic purposes for treating
CC disorders affected by expression of function of novel IL-15 isogene and
CC also of a trageted organ, tissue or cell population of an expection of novel in-15 isogene and
CC average of the pair of the pair of a protein of an in-15 isogene and
CC also or also organing a diagnostic and a management of an expection of novel in-15 isogene and a protein of an in-15 isogene
                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Novel polynucleotides comprising one of 11, PS1-PS11, single nucleotide polymorphisms in human interleukin-15 gene, and useful for treating disorders affected by expression of function of interleukin-15 isogene.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       expression vector that expresses high levels of untranslatable mRNA for

```
This invention relates to a polymucleotide sequence that is a polymorphic variant of the human prostaglandin-endoperoxide synthase 2 (PTGS2) gene also referred to as cyclooxygenase 2. The human PTGS2 gene sequence

APR80896 contains 27 single nucleotide polymorphisms (SNP8). AAPR80896 and AAPR80897 represented by AAB72199. The invention includes PCR and sequencing primers, and probes represented in AAP880898 - AAP81151 which are used to isolated and characterise the PTGS2 gene sequence, and to locate the positions of the SNPS. PTGS2 proteins in for structural analysis or drug-binding studies and also in gene therapy (either expressing PTGS2 or inhibitory RNA). Antibodies raised against PTGS2 are expressing PTGS2 or inhibitory RNA). Antibodies raised against PTGS2 are useful for diagnosis, prognosis and therapy and analysis of the new, and known, polymorphisms and used to determine PTGS2 but also disease

Cused for developing diagnosic transfer and inflammation. The polymorphisms may also be used for developing diagnostic tests and inflammation. The polymorphisms may also be used to study expression and biological function of PTGS2.

Cused for developing diagnostic tests and inflammation. The polymorphisms may also be used to study expression and biological function of PTGS2.
                                                                                                                                                                                                                                                                                                New nucleic acid containing polymorphisms in the cyclooxygenase-2 for gene therapy of inflammation and for establishing a genotype of

The present invention describes an isolated DNA molecule comprising

Example; Page 40; 419pp; English.

```
The present introduction describes an instruction of 745 NORF (not previously assigned open reading frame; or nonamnotated ORF) genes coding sequence of a yeast gene selected from a group of 745 NORF (not previously assigned open reading frame; or nonamnotated ORF) genes (comprising a SAGE (serial analysis of gene expression) tag. Also described are: (1) a method (M1) of using NORF genes to affect the cell cycle comprising administering a NORF gene whose expression varies by at least 10% between any two phases of the cell cycle selected from log phase, S phase and G2/M; (2) a method (M2) for screening candidate antifungal drugs comprising; (a) contacting a test substance with a yeast cell; and (b) monitoring expression of a NORF gene whose expression of the yeast gene is a candidate antifungal drug; (3) a method (M3) for identifying human plum NDN with a probe which comprises at least 10 comprising contacting human DNN with a probe which comprises at least 10 comprision mucleotides of a NORF gene whose expression in a contiguous nucleotides of a NORF gene whose expression in a cyast cell with a candidate drug as a member of a yeast cell comprising contacting a yeast cell with a candidate drug and contacting a yeast cell with a candidate drug and contacting a yeast cell with a candidate drug and contacting a yeast cell with a candidate drug and contacting a yeast cell with a candidate whose corpression is a ffected by the class of drugs. The NORF genes may be used to identify candidate drugs which affect the cell cycle and for identification of antifungal drugs. ARP33268 to AAF41064 crepresent SAGE tags used in the exemplification of the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  method, in the exemplification of the present invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Sequence 10 BP; 1 A; 2 C; 0 G; 7 T; 0 U; 0 Other;

```
The present invention describes an isolated DNA molecule comprising a coding sequence of a yeast gene selected from a group of 745 NORF (not previously assigned open reading frame; or nonannotated ORF) genes comprising a SAGE (serial analysis of gene expression) tag. Also comprising a SAGE (serial analysis of gene whose expression tag. Also described are: (1) a method (M1) of using NORF genes to affect the cell cycle comprising administering a NORF gene whose expression or aries by at the compression and the series of the cell; and (b) monitoring expression of a NORF gene whose expression of antifungal drugs comprising: (a) contacting a test substance which a yeast cell; and (b) monitoring expression of a NORF gene whose expression of the yeast gene is a candidate antifungal drug; (3) a method (M2) for identifying human genes which are involved in cell cycle progression comprising contacting whose expression varies as in M1; and comprising contacting and are involved in cell cycle progression of comprising contacting a yeast cell with a candidate drug as a member of a class of drugs having a characteristic effect on gene expression in a class of drugs having a yeast cell with a candidate drug and contacting expression in the yeast cell of at least 1 NORF gene whose expression is affected by the class of the cell cycle, the differentially contacting and passes of the cell cycle, the differentially contacting and passes of the cell cycle. The expressed genes may be used as markers of phases of the cell cycle. The contact contacting the phases of the cell cycle. The cycle and feet the identification of antifungal drugs. Applases to APAF1368 the APAF1368.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Claim 1; Page 402; 419pp; English.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           원
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The present invention describes an isolated DNA molecule comprising a coding sequence of a yeast gene selected from a group of 745 NORF (not previously assigned open reading frame; or nonannotated ORF) genes coding sequence of serial analysis of gene expression) tag. Also comprising a SAGE (serial analysis of gene expression) tag. Also described are: (1) a method (M1) of using NORF genes to affect the cell cycle comprising administering a NORF gene whose expression arrises by at phase, S phase and G2/M; (2) a method (M2) for screening candidate phase, S phase and G2/M; (2) a method (M2) for screening candidate antifungal drugs; (3) a method (M2) for cell; and (b) monitoring expression of a NORF gene whose expression of the yeast gene is a candidate antifungal drug; (3) a method (M3) for identifying human genes which are involved in cell cycle progression contiguous nucleotides of a NORF gene whose expression in a comprising contacting human DNA with a probe which comprises at least 10 contiguous nucleotides of a NORF gene whose expression in a method (M4) for identifying a yeast cell with a candidate drug as a member of class of drugs having a characteristic effect on gene expression in a yeast cell and for identifying a yeast cell with a candidate drug and monitoring expression in the yeast cell of at least 1 NORF genes may be used as markers of the cell cycle. The methods may be used as markers of the cell cycle. The methods may be used in the exemplification of the present invention cycle and cycle and fetc phases of the cell cycle. The methods may be used in the exemplification of the present invention cycle method, in the exemplification of the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            .;

Yeast gene coding sequences comprising NORF genes with serial analysis of gene expression (SAGE) tags, useful for studying, monitoring and affecting phases of the cell cycle.
      Yeast; Saccharomyces cerevisiae; characterisation; cell cycle; NORF; nor previously assigned open reading frame; nonannotated ORF; SAGE; serial analysis of gene expression; antifungal; tag; identification; linker; PCR primer; ds.

Kinzler K;

The present invention describes an isolated DNA molecule comprising a coding sequence of a yeast gene selected from a group of 745 NORF (not previously assigned open reading frame; or nonannotated ORF) genes comprising a SAGE (serial analysis of gene expression) tag. Also comprising a SAGE (serial analysis of gene expression) tag. Also described are: (1) a method (M1) of using NORF genes to affect the cell cycle comprising administering a NORF gene whose expression varies by at least 10% between any two phases of the cell cycle selected from log phase, S phase and G2/M; (2) a method (M2) for screening candidate antifungal drugs comprising: (a) contacting a test substance with a yeast cell; and (b) monitoring expression of a NORF gene whose expression of the yeast gene is a candidate antifungal drug; (3) a method (M3) for identifying human genes which are involved in cell cycle progression comprising contacting human DNA with a probe which comprises at least 10 contiguous nucleotides of a NORF gene whose expression varies as in M1; and (4) a method (M4) for identifying a candidate drug as a member of a class of drugs having a characteristic effect on gene expression in a cyeast cell comprising contacting a yeast cell with a candidate drug as a member of a crudy, monitor and affect phases of the cell cycle, the differentially expressed genes may be used as markers of phases of the cell cycle. The catudy monitor and affect phases of the cell cycle, the differentially cycle and for identification of antifungal drugs which affect the cell cycle and for identification of antifungal drugs which affect the cell cycle and for identification of the present invention. AAF33262 to AAF33267 represent linkers and PCR primers method, in the exemplification of the present invention

the polymorphisms in the human diphtheria toxin receptor, heparin-binding epidermal growth factor-like growth factor (DTR) gene. DTR gene is located on chromosome 5q23. The polymuclecide comprising polymorphisms in the brownessing state of the compression and function of DTR, and in expression BTR protein for use in screening candidate drugs to treat diseases related to DTR activity. The methods and haplotypes are useful in improving the efficiency and output of several steps in the drug discovery and development process, including target validation, identifying lead compounds, and early phase clinical trials. The kit and methods are useful for determining if an individual has one of the caudying expression of the DTR isogenes in vivo, for in vivo screening and testing of drugs targeted against DTR protein, and for testing the efficacy of therapeutic agents and compounds for tumour growth, smooth muscle hyperplasia or atherosclerosis in a biological system. The present sequence is a primer to detect polymorphisms in human DTR gene
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   New nucleotide polymorphisms in the human diphtheria toxin receptor, heparin-binding epidermal growth factor-like growth factor (DTR) gene, useful for screening or expressing proteins for treating diseases related

The invention relates to single nucleotide polymorphisms in the gene encoding human intercellular adhesion molecule 2 (ICAM2). A method for haplotyping the ICAM2 gene in an individual comprises identifying the nucleotide at one or more polymorphic stres and determining whether one or more polymorphic stres and determining whether one of the copies of the gene is defined by one of the ICAM2 haplotypes given in the specification or whether both copies are defined by a haplotype of pair. This method is useful in genotyping, whereby all possible haplotype or pairs can be assigned to specific genotypes. An association between a trait and a haplotype or haplotype or haplotype of the haplotype or haplotype pair in a reference population, where a higher haplotype or haplotype pair in a reference population, where a higher haplotype or haplotype pair. ICAM2 and its corresponding DNA are used for studying the expression and function of ICAM2, for use in screening for studying the expression and function of ICAM2, for use in screening for studying the effect of variation on the biological activity of ICAM2.

The interior and inflammatory diseases related to ICAM2 activity of ICAM2. The interior of 
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     oligonucleotide probes, sequencing primers, PCR primers and cDNA

polymorphisms in the human interleukin 15 (ILIS) gene. The polymucleotide comprises genes and haplotypes of the ILIS gene. The polymucleotide comprises genes and haplotypes of the ILIS gene. The polymucleotide comprises polymorphic sites referred to as FSI-13 to designate the order in which they are located in the gene. The polymucleotide comprising polymorphisms in the ILIS gene is useful in screening candidate drugs to treat diseases associated to ILIS activity, e.g. infections, human immunodeficiency virus or T cell leukaemia. The ILIS isogenes are sepecially useful for treating these diseases. The methods and haplotypes are useful in improving the efficiency of drug discovery and development processes, or for designing clinical trials of candidate drugs for treating the specific condition or disease. The transgenic animals are useful for studying expression of the ILIS isogenes in vivo, for in vivo screening and testing of drugs targetted against ILIS protein, and for testing the efficacy of the therapeutic agents. The present sequence is
                                                                                                                                                                                                                                                                                                                                                                                                                 New genetic variants comprising haplotypes of the human interleukin 15 (ILL5) gene, useful for treating infections, human immunodeficiency virus or T cell leukemia, or for screening drugs for treating these diseases.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        The invention relates to an isolated polynucleotide, which comprises
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Human; interleukin 15; IL15; haplotype; polymorphic site; PS; drug screening; infection; human immunodeficiency virus; leukaemia; transgenic animal; anti-inflammatory; cytostatic; antibacterial;

The invention relates to an isolated polymucleotide, which comprises polymorphisms in the human interleukin 15 (1115) gene. The polymucleotide comprises and haplotypes of the 1115 gene. The polymucleotide comprises genes and haplotypes of the 1115 gene. The polymucleotide comprises polymorphic sites referred to as PSI-13 to designate the order in which they are located in the gene. The polymucleotide comprising olymorphisms in the 1115 gene. The polymucleotide comprising treat diseases associated to ILI5 activity, e.g. infections, human immunodeficiency virus or T cell leukaemia. The ILI5 isogenes are immunodeficiency virus or T cell leukaemia. The methods and haplotypes are useful in improving the efficiency of drug discovery and development processes, or for designing clinical trials of candidate drugs for treating the specific condition or disease. The transgenic animals are useful for studying expression of the ILI5 isogenes in vivo, for in vivo creening and testing of the therapeutic agents. The present sequence is
                                                                                                                                                                                                                                                        New genetic variants comprising haplotypes of the human interleukin 15 (ILL5) gene, useful for treating infections, human immunodeficiency virus or T cell leukemia, or for screening drugs for treating these diseases.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Human; interleukin 8 receptor beta; IL8RB; ss; antiinflammatory; probe; haplotyping; haplotype pair; single nucleotide polymorphism; genotyping; gene therapy; drug screening; chronic obstructive pulmonary disease;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Gaps

The invention discloses a method for identifying a candidate polymorphic repeat within a coding sequence (expressed sequence tag, EST), which comprises detecting tandem repeats in a target coding sequence, scoring the repeats for polymorphic probability and generating a dataset correlating the repeats with polymorphic probability to identify a correlating the repeats. The computational methods (polymorphic marker prediction of ubiquitous simple sequences, POMPOUS, and Rep-X) are useful for identifying and detecting candidate polymorphic repeats in human genes, which can be used to understand, treat or eliminate genetic diseases, predispositions or adverse drug-treatment reactions. Examples of diseases, linked to nucleotide repeats are Machado-Joseph, Haw River syndrome, Huntington's disease, fragile-X syndrome, Foredisto's ataxis, myconic dystrophy, hyperandrogenaemia, spinal and bulbar atrophy and spinocarebellar ataxia, The sequences presented in ABX79676-ABX80022 are the polymorphic repeats identified for a search of human ESTS
                                                                                                                                                                                                  Identifying a candidate polymorphic repeat within a coding sequence, funderstanding or treating genetic disease, comprises detecting tandem repeats in a target coding sequence and scoring the repeats for
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Sequence 10 BP; 8 A; 0 C; 2 G; 0 T; 0 U; 0 Other;

A method for haplotyping the interleukin 8 receptor beta (ILBRB) gene. A method for haplotyping the conservation and individual comprises identifying the nucleotide at one or more polymorphic sites and determining whether one of the copies of the gene is defined by an ablotype squent in the copy of specification or whether both copies are defined by a haplotype pair. This method is useful in genotyping, whereby all possible haplotype pair. This method is useful in genotypes. An association between a trait and comparing the frequency of the haplotype pair in a comparing the frequency of the haplotype pair in a reference population, where a higher haplotype or haplotype pair in a reference population, where a higher haplotype or haplotype pair in a reference population of ILBRB, dear a sociated with the frequency in the trait population indicates the trait is associated with constructive pulmonary disease and other inflammatory disorders. The sequences are also useful for studying the expression and function of ILBRB activity, such as choosical activity of ILBRB as well as on the binding affinity of candidate drugs targeting ILBRB sequences AAS95525-AAS95579 represent
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            ö
                                                                                                                                                                                     New polymorphic variants comprising interleukin-8 receptor beta (ILBRB) isogene, useful in expressing ILBRB protein for use in screening for candidate drugs to treat diseases related to ILBRB activity, e.g. inflammatory disorders.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Gaps

```
The present invention describes a library comprising polypeptides. Bach polypeptide comprises a first or second zinc finger domain. The domains of each polypeptide are identical to a zinc finger domain from a naturally occurring protein and either do not occur in the same naturally occurring protein or occur in the same naturally occurring protein or occur in the same naturally occurring protein in a different configuration than in the polypeptide. The domains vary among polypeptides. Also described. (1) producing chimeric nucleic acids; (2) generating an artificial zinc finger polypeptide that specifically binds to a target DNA site; and (3) identifying a nucleic acid encoding a zinc finger polypeptide that specifically recognises a target DNA site. The library can be used for producing chimeric nucleic acids. ACC41551 to ACC41758 and ABR40919 to ABR41015 represent nucleotide and amino acid sequences given in the exemplification of the present invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The present sequence represents a potential triple-helix forming region. It can be used to demonstrate the assay of the invention. The assay comprises adding a sample containing double-stranded DNA test sequences, e.g. containing the present sequence, to an aqueous medium containing at least one complex of anchor DNA, attached to a solid support, and reporter DNA, where either a part of the anchor DNA or reporter DNA is designed to form a triple-strand structure with part of the test sequence. Triplex formation results in displacement of the reporter DNA which is detected as an indication of the presence of the DNA test
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Assay of genetic sequences based on triplex formation from double stranded analyte - and hybrid of anchor and reporter sequences, with reporter released if triplex formation occurs, used e.g. to identify
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Gaps

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        The invention relates to identifying (M1) genes in vitro that, in humans or animals, are important for skin ageing and/or skin stress by serial analysis of gene expression between mixtures of transcribed and optionally translated, genetically encoded factors (A) obtained from young and aged skin, to identify that genes that show strong differential expression. (A) comprises protein or mRNAs or their fragments. (M1) is useful for: identifying markers of skin ageing and/or stress; determining skin ageing and/or stress; and identifying or determining the effects of pharmaceutical or cosmetic agents for control of skin ageing. The present sequence is one of a group of human skin ageing/stress related expressed
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Identifying genes involved in skin stress and aging, useful e.g. in screening for cosmetic or therapeutic agents, based on differential gene

The invention relates to in vitro identification (M1) of genes expressed in the skin of humans or animals by subjecting a mixture of genetically encoded factors from skin, to serial analysis of gene expression (SAGE) so as to identify skin-expressed genes and quantify their expression.

(M1) is useful for identifying genes involved in skin homeostasis; to promotes skin homeostasis and to test agent (A) that maintains or promotes skin homeostasis or that can be used for treating skin disorders, specifically neurodermatitis; sunburn; psoriasis; scleroderma; ichthyosis; atopic dermaritis; acne; seborrhea; lupus erythematosus; rosceae, melanoma; basal cell carcinoma; and carcinoma or sarcoma of the skin. The present sequence is that of a human expressed sequence tag (EST) of the invention
                                                                                                                                                                                                                                                                                                                                           In vitro identification of skin-expressed genes, useful for determining homeostasis and identifying cosmetic or pharmaceutical agents against

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             The invention relates to in vitro identification (MI) of genes expressed in the skin of humans or animals by subjecting a mixture of genetically encoded factors from skin, to serial analysis of gene expression (SAGE) so as to identify skin-expressed genes and quantify their expression. (MI) is useful for identifying genes involved in skin homeostasis; to promotes skin homeostasis and to test agent (A) that maintains or promotes skin homeostasis or that can be used for treating skin disorders, specifically neurodermatitis; sunburn; psoriasis; scleroderma;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   the

```
The invention relates to in vitro identification (M1) of genes expressed in the skin of humans or animals by subjecting a mixture of genetically encoded factors from skin, to serial analysis of gene expression ($AGE$) so as to identify skin-expressed genes and quantify their expression. (M1) is useful for identifying genes involved in skin homeostasis; to promotes skin homeostasis and to test agent (A) that maintains or promotes skin homeostasis or that can be used for treating skin disorders, specifically neurodermatitis; sunburn; psoriasis; scleroderma; inchthyosis; atopic dermatitis; acnes, seborrhea; lupus erythematosus; rosaces, melanoma; basal cell carcinoma, and carcinoma or starcoma of the skin. The present sequence is that of a human expressed sequence tag
In vitro identification of skin-expressed genes, useful for determining homeostasis and identifying cosmetic or pharmaceutical agents against

The method comprises recovering, from facial skin, a first mixture of genetically expressed (transcribed and optionally translated) factors (i.e. proteins, mRNA or their fragments), recovering a second, similar mixture from some other human tissue, preferably skin from a protected area, especially from the breast and subjecting the mixtures to serial analysis of gene expression (SAGE) to identify those genes for which expression is markedly different between facial skin and the other tissue. The invention also describes an in vitro method for determining homeostasis of human facial skin, a test kit which comprises that bind specifically to the factors of innerset and a blochip for determining homeostasis of human facial skin. The products of the invention are also used in a method which determines activity of
such as fracture, chondrodystrophy, osteodystrophy, osteoporosis, osteoarthritis, rheumatodid arthritis, synovitis and metabolic arthritis, and as markers in the diagnosis of the above conditions. The present sequence is a polynucleotide sequence shown in the exemplification of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         cosmetic and pharmaceutical agents for use against disorders or disturbances of the homeostasis of human skin and a screening method for identifying cosmetic and pharmaceutical agents. The method allows identification of as many as possible of the genes important for facial skin and thus of a very wide range of potential therapeutic and cosmetic agents. ADQ31911-ADQ35111 represent human DNA Tag fragments used to
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               In vitro identification of genes important for facial skin, useful for assessing homeostasis and in screening for pharmaceutical or cosmetic
                                                                                                                                                                                                      Gaps

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              ઠે
                                                                          ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The present sequence represents a potential triple-helix forming region. It can be used to demonstrate the assay of the invention. The assay comprises adding a sample containing double-stranded DNA test sequences, e.g. contraining the present sequence, to an aqueous medium containing at least one complex of anchor DNA, attached to a solid support, and reporter DNA, where either a part of the anchor DNA or reporter DNA is sequence. Triples formation results in displacement of the test sequence. Triples formation results in displacement of the reporter DNA which is detected as an indication of the presence of the DNA test sequence. The method is used to detect DNA sequences, particularly for identification of bacteria (by detecting genes for ribosomal RNA) in clinical samples, but also detection of oncogenes and Hepatitis B virus
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Assay of genetic sequences based on triplex formation from double stranded analyte - and hybrid of anchor and reporter sequences, with reporter released if triplex formation occurs, used e.g. to identify bacteria.
identify the facial skin-associated genes described in the invention.

The present sequence represents a potential triple-helix forming region. It can be used to demonstrate the assay of the invention. The assay comprises adding a sample containing double-stranded DNA test sequences, e.g. containing the present sequence, to an aqueous medium containing at least one complex of anchor DNA, attached to a solid support, and reporter DNA, where either a part of the anchor DNA or reporter DNA is designed to form a triple-strand structure with part of the test sequence. Triplex formation results in displacement of the reporter DNA which is detected as an indication of the presence of the DNA test sequence. The method is used to detect DNA sequences, particularly for identification of bacteria (by detecting genes for ribosomal RNA) in clinical samples, but also detection of oncogenes and Hepatitis B virus
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Melting temperature; Tm; nucleic acid duplex; binding ligand; mismatch; sequencing; hybridisation; binding energy; stringency; ss.

This invention describes a method for normalising the melting temperatures (Tm) of at least two nucleic acid duplexes by contacting the duplexes with a reaction mixture containing a binding ligand that binds preferentially to one of the duplexes. The binding ligand that binds increase or decrease the differences in Tm between AT- and GC-rich duplexes, particularly in sequencing by hybridisation methods or, by increase in binding energies, to increase stringency and decrease hybridisation of mismatched gene sequences, e.g. in assays for specific targets. By normalising Tm, sequence-dependent differences in binding to a probe are eliminated. This allows accurate sequencing by hybridisation, a method that can potentially provide large amounts of sequence information in a single experiment by using many probes in an array but currently is associated with problems of binding of probes with
                                                                                                                                                                                                                                                                                                                                                                                                       Normalising melting temperatures of different nucleic acid duplexes - by the addition of a ligand that binds in base-preferred manner to modulate duplex stability, particularly for sequencing by hybridisation.

(GENZ) GENZYME CORP. (ROBE/) ROBERTS B L. (SHAN/) SHANKARA S.

```
Sequences AAZ77573-Z79709 represent SAGE (serial analysis of gene expression) tags used to identify mRNA transcripts encoding immunostimulatory cofactor proteins which are preferentially or differentially expressed in monocyte-derived dendritic cells compared with monocytes. Some of the transcripts correspond to known genes or ESTS (expressed sequence tags) which were previously unknown to be preferentially or differentially expressed in dendritic cells, while there transcripts correspond to novel genes. Antigen-presenting cell cother transcripts or correspond to novel genes. Antigen-presenting cell complex) and subsequent recognition by T-cell receptors is alone insufficient to activate a robust cytocoxic immune response that can lyse the tumour cells, immunostimulatory cofactors also being required for efficient activation of cytocoxic Tymphocytes (CTLs). Nucleic acid sequences identified using the SAGE tags have several potential uses. They may be used in vaccines to induce an immune response, particularly gainst a tumour antigen; to modulate the genotype of an APC; to screen for against a tumour antigen; to modulate the genotype of an APC; and as hybridiation probes/amplification primers for the diagnosis, prognosis and monitoring of diseases related to abnormal expressed genes. Detection of the dendritic cell differentially captessed genes, or of their encoded proteins, can be used to active immunotherapy (or to stimulate production of a copulation of antigen-specific effector cells) and vectors containing
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Isolated polynucleotides differentially expressed in antigen-presenting cells, useful in gene vaccines against cancer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Claim 1; Page 66; 130pp; English.

ö
them are used in gene therapy. Co-administration of tumour antigens and APC-associated costimulatory factors ensures adequate antigen presentation to endogenous APCs and upregulates the APCs for the presentation of co-atimulatory signals, migration to T cell-rich sites, secretion of T cell growth factors and secretion of chemokines for recruitment of immune effector cells

Sequences AA277573-279709 represent SAGE (serial analysis of gene expression) tags used to identify mRNA transcripts encoding immunostimilatory cofactor proteins which are preferentially or differentially expressed in monocyte-derived dendritic cells compared with monocytes. Some of the transcripts correspond to known genes or ESTS (expressed sequence tags) which were previously unknown to be preferentially or differentially expressed in dendritic cells, while cher transcripts correspond to novel genes. Antigen-presenting cell cher transcripts correspond to novel genes. Antigen-presenting cell activation of the cytotoxic immune response, particularly against tumour cells. Tumour antigen presentation via the MHC (major histocompatibility complex) and subsequent recognition by T-cell receptors is alone insufficient to activate a robust cytotoxic immune response that can lyse the tumour activation of cytotoxic Tumphocytes (CTLS). Nucleic call cafficient activation of cytotoxic T-lymphocytes (CTLS). Nucleic acid sequences identified using the SAGE tags have several potential uses.

They may be used in vaccines to induce an immune response, particularly expressed genes in the manual particulation primers for the another against a tumour antigen, to modulate the genotype of an APC; to screen gainst a tumour antigen, proposis and monitoring of diseases related to abnormal diagnosis, prognosis and monitoring of diseases related to abnormal categories and active immunotherapy (or to estimulate production of an eused in active immunotherapy (or to estimulate production of them are used in active immunotherapy (or to estimulate production of constimulatory factors ensures adequate antigen and the presentation of co-stimulatory signals, migration to Thempsells of thempsells o

                                                                                                                                                                                                                                                                              원
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              expression) tags used to identify many transcripts encoding immunostimilatory cofactor proteins which are preferentially or differentially expressed in monocyte-derived dendritic cells compared with monocytes. Some of the transcripts correspond to known genes or ESTS (expressed sequence tags) which were previously unknown to be correspond to monocytes. Some of ifferentially expressed in dendritic cells, while other transcripts correspond to novel genes. Antigen-presenting cell cother transcripts correspond to novel genes. Antigen-presenting cells cativation of the cyctocxic immune response, particularly against tumour cells. Tumour antigen presentation via the MHC (major histocompatibility complex) and subsequent recognition by T-cell receptors is alone insufficient to activate a robust cyctoxic immune response that can lyse the tumour cells, immunostimulatory cofactors also being required for efficient activation of cyctoxic T-lymphocytes (CTLS). Nucleic acid sequences identified using the SAGE tags have several potential uses.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               They may be used in vaccines to induce an immune response, particularly against a tumour antigen; to modulate the genotype of an APC; to screen for agents that modulate expression of differentially expressed genes in an APC; and as hybridisation probes/amplification primers for the diagnosis, prognosis and monitoring of diseases related to abnormal expression of these genes. Detection of the dendritic cell differentially expressed genes, or of their encoded proteins, can be used to identify cells as belonging to the monocyte lineage. Cells containing these genes can be used in active immunotherapy (or to stimulate production of a
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             expressed in antigen-presenting
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Sequences AAZ77573-Z79709 represent SAGE (serial analysis of gene

ö
population of antigen-specific effector cells) and vectors containing them are used in gene therapy. Co-administration of tumour antigens and APC-associated costimulatory factors ensures adequate antigen presentation to endogenous APCs and upregulates the APCs for the presentation of co-stimulatory signals, migration to T cell-rich sites, secretion of T cell growth factors and secretion of chemokines for recruitment of immune effector cells
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                SAGE tag; serial analysis of gene expression; antigen-presenting cell; APC; moncoyte-derived dendritic cell; differential gene expression; immunostimulatory cofactor; costimulatory factor; CTL; cytotoxic T-lymphocyte; tumour antigen; immunotherapy; anticancer; ss.

Sequences AAZ7757-279709 represent SAGE (serial analysis of gene expression) tags used to identify mRNA transcripts encoding cypressed to forector proteins which are preferentially or differentially expressed in monocyte-derived dendritic cells compared differentially expressed in monocyte-derived dendritic cells compared with monocytes. Some of the transcripts correspond to known genes or ESTS (preferentially or differentially expressed in dendritic cells, while correspond to novel genes. Antigen-presenting cells preferentially or differentially expressed in dendritic cells, while correspond to novel genes. Antigen-presenting cells that the transcripts correspond to novel genes. Antigen-presenting cells complex) and subsequent recognition by T-cell receptors is alone cells. Thunuar antigen presentation via the MRC (major histocompatibility complex) and subsequent recognitual to the cytocoxic immune response that can lyse complex. Immunostimulatory cofactors also being required for the tumour cells, immunostimulatory cofactors also being required for the tumour cells, immunostimulatory cofactors also being required for efficient activation of cytocoxic T-lymphocytes (CTLS). Nucleic acid sequences identified using the SAGE tags have several potential uses. Sequences identified using the SAGE tags have several potential uses. They may be used in vaccines to modulate the genotype of an APC; to screen gainst a tumour antigen; to modulate expression of differentially expressed genes in an APC; and as hybridiation probes/amplification primers for the expression of the eduritic cell differentially expressed genes, or of their encoded proteins, can be used to identify cappealation probes/amplification of the are used in active immunothersy (or to stimulate production of a cappulation of antigen-specific effector cells) and vectors containing the presentation of endogenous APCs and upregulates the APCs for the monocyte insures adequate antigen presentation of cell growth factors ensures adequate antigen sites. ```
that are preferentially transcribed in the metastatic breast tumour cells). AAZ81941 tepresent tags corresponding to distinct transcripts that are preferentially transcribed in metastatic breast tumour cells). AAZ81942 to AAZ81677 represent tags corresponding to distinct transcribts that are preferentially transcribed in the primary or non-metastatic breast tumour tissue (i.e. are downregulated in metastatic breast tumour cells). These transcripts can be used for diagnosis, prognosis, monitoring and treatment of breast cancer, particularly where metastatic. Diagnosis is by standard immunoassays or hybridisation/amplification reactions. Compounds that modulate expression of the transcripts are potentially useful for treatment of (metastatic) breast cancer, while promoters from the transcripts are used to direct expression, in selected cell types, of e.g. therapeutic genes (also ribozymes or antisense sequences).

CC e.g. therapeutic genes (also ribozymes or antisense sequences).

CC particularly an antigen-encoding sequence for use in gene or cell-based vaccines; for diagnosing breast cancer and for raising specific antibodies (Ab). Ab are used to detect the polypeptides or as therapeutic and isolate populations of educated, antigen-encoded, antigen-encoded and isolate populations of educated, antigen-encoded cand isolate populations of educated, antigenes and be used to expand calls.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Isolated polynucleotides differentially expressed between metastatic and non-metastatic breast cancer cells, useful for diagnosis, prevention and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Human; metastatic breast tumour tissue; breast cancer; tag; primer;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                that are preferentially transcribed in the metastatic breast tumour tissue (i.e. are upregulated in metastatic breast tumour cells). AAZ83942 to AAZ86677 represent tags corresponding to distinct transcribts that are preferentially transcribed in metastatic breast tumour cells). AAZ83942 to AAZ86677 represent tags corresponding to distinct transcribts that are preferentially transcribed in the primary or non-metastatic breast tumour cells). These transcribts can be used for diagnosis, prognosis, monitoring and transcribts can be used for diagnosis, prognosis, monitoring and transcribts can be used for diagnosis, prognosis, monitoring and transcribts can be used for diagnosis, prognosis, monitoring and transcribts are used for diagnosis of the transcripts are potentially useful for treatment of (metastatic) breast cancer, while promoters from the transcripts are used to direct expression, in selected cell types, of e.g. therapeutic genes (also ribozymes or antisense sequences), particularly an antigen-encoding sequence for use in gene or cell-based vaccines; for diagnosing breast cancer and for raising specific antibodies (Ab). Ab are used to detect the polypeptides or as therapeutic and isolate populations of educated, antigen-specific immune effecter.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               ö

AAZ80767 to AAZ83941 represent tags corresponding to distinct transcripts that are preferentially transcribed in the metastatic breast tumour cells). AAZ83942 tissue (i.e. are upregulated in metastatic breast tumour cells). AAZ83942 to AAZ86677 represent tags corresponding to distinct transcripts that are preferentially transcribed in the primary or non-metastatic breast tumour cells). These tissue (i.e. are downregulated in metastatic breast tumour cells). These transcripts can be used for diagnosis, prognosis, monitoring and transcripts can be used for diagnosis, prognosis, monitoring and transcripts are modulate expression of the transcripts are potentially useful for treatment of (metastatic) breast cancer, while promoters from the transcripts are used to direct expression, in selected cell types, of the transcripts are used to direct expression, in selected cell types, of e.g. therapeutic genes (also ribozymes or antisense sequences).

The particularly an antigen-encoding sequence for use in gene or cell-based vaccines; for diagnosing breast cancer and for raising specific antibodies (Ab). Ab are used to detect the polypeptides or as therapeutic and isolate populations of educated, antigen-specific immune effecter cells, e.g. cytotoxic T lymphocytes, and these used for adoptive

AAZ80767 to AAZ83941 represent tags corresponding to distinct transcripts

that are preferentially transcribed in the metastatic breast tumour

tissue (i.e. are upregulated in metastatic breast tumour cells). AAZ83942

to AAZ86677 represent tags corresponding to distinct transcripts that are

to AAZ86677 represent tags corresponding to distinct transcripts that are

transcripts can be used for diagnosis, monitoring and

transcripts and be used for diagnosis, monitoring and

treatment of breast cancer, particularly where metastatic. Diagnosis is

treatment of breast cancer, particularly where metastatic. Diagnosis is

by standard immunoassays or hybridisation/amplification reactions.

Compounds that modulate expression of the transcripts are potentially

useful for treatment of (metastatic) breast cancer, while promoters from

the transcripts are used to direct expression, in selected cell types, of

that are preferentially transcribed in the metastatic breast tumour cells). AAZ80767 to AAZ80341 represent tags corresponding to distinct transcripts that are preferentially transcribed in metastatic breast tumour cells). AAZ30342 to AAZ86677 represent tags corresponding to distinct transcripts that are preferentially transcribed in the primary or non-metastatic breast tumour cells). These tissue (i.e. are downregulated in metastatic breast tumour cells). These transcripts can be used for diagnosis, prognosis, monitoring and treatment of breast cancer, particularly where metastatic. Diagnosis is by standard immunoassays or hybridisation/amplification reactions. Compounds that modulate expression of the transcripts are potentially useful for treatment of (metastatic) breast cancer, while promoters from the transcripts are used to direct expression, in selected cell types, of e.g. therapeutic genes (also ribozymes or antisense sequences), particularly an antigen-encoding sequence for use in gene or cell-based vaccines. For diagnosing breast cancer and for raising specific vaccines; for diagnosing breast cancer and for raising specific antibodies (Ab). Ab are used to detect the polypeptides or as therapeutic agents. Host cells that produce the polypeptides can be used to expand and isolate populations of educated, antigen-specific immune effecter
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 and isolate populations of educated, antigen-specific immune efficells, e.g. cytotoxic T lymphocytes, and these used for adoptive

that are preferentially transcribed in the metastatic breast tumour cells). AAZ80767 to AAZ80341 represent tags corresponding to distinct transcripts that are preferentially transcribed in metastatic breast tumour cells). AAZ80342 to AAZ80677 represent tags corresponding to distinct transcripts that are preferentially transcribed in the primary or non-metastatic breast tumour tissue (i.e. are downregulated in metastatic breast tumour cells). These transcripts can be used for diagnosis, prognosis, monitoring and treatment of breast cancer, particularly where metastatic. Diagnosis is by standard immunoassays or hybridisation/amplification reactions. Compounds that modulate expression of the transcripts are potentially useful for treatment of (metastatic) breast cancer, while promoters from the transcripts are used to direct expression, in selected cell types, of e.g. therapeutic genes (also ribozymes or antisense sequences), particularly an antigen-encoding sequence for use in gene or cell-based vaccines. Polypeptides encoded by the transcripts are also useful in vaccines. For diagnosing breast cancer and for raising specific antibodies (Ab). Ab are used to detect the polypeptides or as therapeutic antibodies (Ab). Ab are used to detect the polypeptides or as therapeutic and isolate populations of educated, antigen-specific immune effecter

AAZ80767 to AAZ83941 represent tags corresponding to distinct transcripts

CC that are preferentially transcribed in the metastatic breast tumour

CL tissue (i.e. are upregulated in metastatic breast tumour cells). AAZ83942

CC tissue (i.e. are upresent tags corresponding to distinct transcripts that are

CC preferentially transcribed in the primary or non-metastatic breast tumour

CC transcripts can be used for diagnosis, monitoring and

CC transcripts can be used for diagnosis, monitoring and

CC transcripts are between the particularly where metastatic. Diagnosis is

CC compounds that modulate expression of the transcripts are potentially

CC compounds that modulate expression of the transcripts are potentially

CC systil for treatment of (metastatic) breast cancer, while promoters from

CC the transcripts are used to direct expression, in selected cell types, of

CC e.g. therapeutic genes (also ribozymes or antisense sequences),

CC particularly an antigen-encoding sequence for use in gene or cell-based

CC particularly an antigen-encoding sequence for use in gene or cell-based

CC antibodies (Ab). Ab are used to detect the polypeptides are also useful in

CC vaccines; for diagnosing breast cancer and for raising specific

CC antibodies (Ab). Ab are used to detect the polypeptides or as therapeutic

CC antibodies (Ab). Ab are used to detect the polypeptides or as therapeutic

CC antibodies (Ab). Ab are used to detect the polypeptides or as therapeutic

CC antibodies (Ab). Ab are used be used to expand

CC ells, e.g. cytotoxic T lymphocytes, and these used for adoptive

CC immortherapeutic

```
that are preferentially transcribed in the metastatic breast tumour that are preferentially transcribed in the metastatic breast tumour cells). AAZ83942 to AAZ86677 represent tags corresponding to distinct transcripts that are preferentially transcribed in the primary or non-metastatic breast tumour cells). These preferentially transcribed in the primary or non-metastatic breast tumour tissue (i.e. are downregulated in metastatic breast tumour cells). These transcripts can be used for diagnosis, prognosis, monitoring and treatment of breast cancer, particularly where metastatic. Diagnosis is by standard immunoassays or hybridisation/amplification reactions. Compounds that modulate expression of the transcripts are potentially useful for treatment of (metastatic) breast cancer, while promoters from the transcripts are used to direct expression, in selected cell types, of c.g. therapeutic genes (also ribozymes or antisense sequences), particularly an antigen-encoding sequence for use in gene or cell-based vaccines; for diagnosing breast cancer and for raising specific cantibodies (Ab). Ab are used to detect the polypeptides or as therapeutic and isolate populations of educated, antispense say therapeutic and isolate populations of educated, antispense can be used to expand and isolate populations of educated, antispense used for adoptive cells, cells, cells, and these used for adoptive
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Isolated polynucleotides differentially expressed between metastatic and non-metastatic breast cancer cells, useful for diagnosis, prevention and

```
The present invention describes a group of genes consisting of 100 genes which are highly expressed in human dendritic cells; a group of genes which are expressed at a higher frequency in human dendritic cells than in human monocytes; and a group of genes which are expressed at lower frequency in human monocytes. Each group of genes are characterised in that cDNAs of these genes respectively have the base sequences of SEQ ID NO:1 to 100 (AAC73914 to AAC74013), SEQ ID NO:101 to 200 (AAC74014 to AAC74113) and SEQ ID NO:201 to 300 (AAC74114 to AAC74113), according with the base sequences of SCA continuous with the base sequence of continuous with the base sequence on be used for the investigation of the role and mechanism of the involvement of
                                                                                                                                                                                                                                                                                                                                                                                                                    Groups of genes expressed in human dendritic cells at a greater or lesser extent than in monocytes for investigation and diagnosis of autoimmune disease and tumors.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                dendritic cells in the immune system and for the study and diagnosis of diseases in which dendritic cells play a significant role, e.g. cancers

The present invention describes 100 human genes, which are expressed most frequently in human monocytes. The CDNA of each gene has a sequence fully defined in the specification, and lacking the CATG sequence located adjacent to polyA region. Also described are: (1) an antibody pecifically for the protein encoded by any of the genes; (2) specifically for the protein encoded by any of the genes; (3) 380 human genes oligonucleotides obtained from the CDNA sequences; (3) 380 human genes monocytes by granulcyte-macrophage colony-stimulating factor, the CDNA of each gene has a fully defined sequence; given in the specification, lacking the base sequence CATG located most closely to the poly A region; (4) an antibody specifically for the protein encoded by any of the genes of (3); and (5) oligonucleotides obtained from the CDNA sequences of (3). The genes and CDNAs, are used for the strong from the CDNA sequences of (3). The genes and CDNAs, are used for the strong of security and disease onset mechanism e.g. oncogenesis, genetic diseases, drug development and diagnosis. AAA56107 to AAA56586 represent specifically continued to a sequences for human genes
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Genes most frequently expressed in human monocytes and GM-macrophages and M-macrophages studied and with cDNAs characterized, for study of gene specificity, disease onset mechanism, drug development and diagnosis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Human; monocyte; macrophage; GM-macrophage; M-macrophage; tag; granulocyte-macrophage colony-stimulating factor; characterisation; GM-CSF; identification; diagnosis; gene specificity; oncogenesis; disease onset mechanism; genetic disease; drug development; ss.

The present invention describes 100 human genes, which are expressed most frequently in human monocytes. The cDNA of each gene has a sequence fully defined in the specification, and lacking the CATG sequence located construction and lacking the CATG sequence located defined in the specification, and lacking the CATG sequence located considerable for the protein encoded by any of the genes; (2) specifically for the protein encoded by any of the genes; (3) 380 human genes oligonucleotides obtained from the cDNA sequences; (3) 380 human genes which are expressed most fragmently in human macrophages, differentiated from human monocytes by granulocyte-macrophage colony-stimulating factor, from human monocytes by granulocyte-macrophage colony-stimulating factor, consectification, lacking the base sequence CATG located most closely to the specification, (4) an antibody specifically for the protein encoded by colony A region; (4) an antibody specifically for the protein encoded by colony A region; (4) and disponses and cDNAs, are used for the study of gene sequences of (3). The genes and cDNAs, are used for the study of gene specificity and disease onset mechanism e.g. oncogenesis, genetic specifically claimed oligonucleotide tag sequences for human genes specifically claimed oligonucleotide tag sequences for human genes
                                                                                                                                                                                                                                                                Genes most frequently expressed in human monocytes and GM-macrophages and M-macrophages studied and with cDNAs characterized, for study of gene specificity, disease onset mechanism, drug development and diagnosis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Human; transcriptome; gene expression pattern; cancer; drug screening; cancer diagnosis; cell specific gene expression; ss.

                                                                                                                                                                                                                                                                                                                                ö
                                                                                                                                                   The present invention describes a method of identifying the type of cell in a sample, involving determining which of the sequences AAH63161-AAH64724 is expressed by the cell. The transcriptomes described in the invention are cell-type specific, cancer specific or ubiquitously expressed in humans. They can also be used to screen for drugs, reduce cancer specific gene expression, standardalse expression and restore the function of a diseased cell or tissue. The present sequence is one of the transcriptomes described in the exemplification of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The present invention describes a method of identifying the type of cell in a sample, involving determining which of the sequences AAH63161-AAH64724 is expressed by the cell.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               The present invention describes a method of identifying the type of cell in a sample, involving determining which of the sequences AAH63161-AAH64724 is expressed by the cell. The transcriptomes described in the invention are cell-type specific, cancer specific or ubiquitously expressed in humans. They can also be used to screen for drugs, reduce cancer specific gene expression, standardise expression and restore the function of a diseased cell or tissue. The present sequence is one of the transcriptomes described in the exemplification of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    New isolated polynucleotides, useful for identifying specific cell type, such as cancer cell, comprises transcriptomes expressed in particular
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Human; transcriptome; gene expression pattern; cancer; drug screening;

The present invention describes an lipopolysaccharide (LPS) activated human monocyte expression gene group consisting of the high-ranking 50 genes of the highest expression among the genes expressed by human monocyte stimulated by LPS in which the cDNA of each gene has the base sequence of (AAH32628 to AAH32677) continuous to the base sequence 5'-CATG-3' nearest to the polyA region. The gene group is useful for the development of new means for the diagnosis and the treatment of various human diseases in which human monocyte plays an important role. AAH32628 to AAH32943 represent specifically claimed LPS activated human monocyte processed and LPS activated human monocyte expression gene cDNA tags from the present invention. AAH332944 represents an LPS activated human monocyte expression gene cDNA sequence encoding AAB98009, which are given in the exemplification of the present invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Yeast; Saccharomyces cerevisiae; characterisation; cell cycle; NORF; nor previously assigned open reading frame; nonannotated ORF; SAGE; serial analysis of gene expression; antifungal; tag; identification; linker; PCR primer; d8.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             The present invention describes an isolated polymuclectide (I) comprising a muclectide sequence (S) which is a polymorphic variant of a reference sequence for the human immunoglobulin E receptor I alpha subunit (IGERA) (gene or its fragment. The polymorphic cariant comprises at least lone polymorphism selected from guanine (G) at polymorphic site (PS) 1, PS9, pS10 or PS21, cytosine (C) at PS2, PS3, PS6, PS12, PS18 or PS20, adenine (C) at PS1, PS13, PS14, PS15, PS19, or PS22 and thymine (T) at PS4, PS8, PS17, PS17, or (G) at a position corresponding to nucleotide 30 or 741, and (T) at a position corresponding to nucleotide 50 or 10 can be used in gene a position corresponding to nucleotide 50 or 10 can be used in gene a position corresponding to nucleotide 50 or 11 can be used in gene a position corresponding to nucleotide 50 or 741, and (T) at a position corresponding screening assays and in assays to encoded by (I) is useful in drug screening assays and in assays to encoded by (I) is useful in drug screening assays and in assays to encoded by (II) to useful in immunobalots of (II) is useful in immunobalots of polyacrylamide gels on membrane supports or substrates. (III) is also useful in immunoassays to detect (II) in biological samples. AAP99097 to useful in immunoassays to detect (II) in biological samples. AAP99097 to AAF98104 represent IGERA gene polymorphism detection primers; and the control of the AAF9814 or prepared to the polymorphism detection primers; and the control of the AAF9814 or prepared to the control of the polymorphism detection primers; and the control of the con
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              , polynuclectide for gene therapy, comprises nuclectide polymorphisms the immunoglobulin E receptor I alpha subunit gene.

The present invention describes an isolated DNA molecule comprising a coding sequence of a yeast gene selected from a group of 745 NORF (not previously assigned open reading frame; or nonannotated ORF) genes comprising a SAGE (serial analysis of gene expression) tag. Also comprising a SAGE (serial analysis of gene expression) tag. Also described are: (1) a method (M1) of using NORF genes to affect the cell cycle comprising administering a NORF gene whose expression varies by at least 10% between any two phases of the cell cycle selected from log phase, S phase and G2/M; (2) a method (M2) for screening candidate antifungal drugs comprising: (a) contacting a test substance with a yeast cell; and (b) monitoring expression of a NORF gene whose expression of the yeast gene is a candidate antifungal drug; (3) a method (M3) for comprising contacting are involved in cell cycle progression of the yeast gene is a candidate antifungal drug; (3) a method (M3) for comprising contacting are involved in cell cycle progression contiguous nucleotides of a NORF gene whose expression varies as in M1; and (4) a method (M4) for identifying a candidate drug as a member of a class of drugs having a characteristic effect on gene expression in a yeast cell of at least 1 NORF gene whose expression is affected by the class of drugs. The NORF genes may be used to in the yeast cell with a candidate drug and expression is affected phases of the cell cycle, the differentially expressed genes may be used as markers of phases of the cell cycle. The methods may be used to identify candidate drugs which affect the cell cycle and for identification of antifungal drugs. App33268 to AAF44064, represent SAGE tags used in the exemplatics promession of the present invention.
                                                                                                                                     Yeast gene coding sequences comprising NORF genes with serial analysis of
                                                                                                                                                                   gene expression (SAGE) tags, useful for studying, monitoring and affecting phases of the cell cycle.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  method, in the exemplification of the present invention

Yeast gene coding sequences comprising NORF genes with serial analysis of gene expression (SAGE) tags, useful for studying, monitoring and affecting phases of the cell cycle.

Claim 1; Page 387; 419pp; English.

The present invention describes an isolated DNA molecule comprising a coding sequence of a yeast gene selected from a group of 745 NORF (not previoually assigned open reading frame, or nonamnotated ORF) genes comprising a SAGE (serial analysis of gene expression) tag. Also described are: (1) a method (M1) of using NORF genes to affect the cell cycle comprising administering a NORF gene whose expression varies by at contacting a test substance with a yeast confidence of the cell cycle selected from log phase, S phase and G2/M; (2) a method (M2) for screening candidate earlity and (b) monitoring expression of a NORF gene whose expression of cell; and (b) monitoring expression of a NORF gene whose expression of the yeast gene is a candidate antitungal drug; (3) a method (M3) for identifying human genes which are involved in cell cycle progression of the yeast gene is a candidate antitungal drug; (3) a method (M3) for identifying a probe which comprises at least 10 comprising contacting a yeast cell of a method (M4) for identifying a candidate drug as a member of a class of drugs having a characteristic effect on gene expression in a contitoring expression in the yeast cell of at least 1 NORF gene whose expression is affected by the class of the cell cycle, the differentially expression is affect by the class of the cell cycle. The monitoring expression of antifurgal drugs. The NORF genes may be used to identify candidate drugs which affect the cell cycle. The methods may be used to identify candidate drugs which affect the cell cycle cycle and for identification of antifurgal drugs. AB73326 to AAR33267 represent linkers and PCR primers used in the exemplification of the present invention.

The present invention describes an isolated DNA molecule comprising a coding sequence of a yeast gene selected from a group of 745 NORF (not previously assigned open reading frame; or nonannotated ORF) genes comprising a SAGE (serial analysis of gene expression) tag. Also described are: (1) a method (M1) of using NORF genes to affect the cell cycle comprising administering a NORF gene whose expression varies by at cleast 10% between any two phases of the cell cycle selected from log phase, S phase and G2/M; (2) a method (M2) for screening candidate antifungal drugs comprising: (a) contacting a test substance with a yeast cell; and (b) monitoring expression of a NORF gene whose expression of the yeast gene is a candidate antifungal drug; (3) a method (M3) for identifying human genes which are involved in cell cycle progression of the yeast gene is a candidate antifungal drug; (3) a method (M3) for identifying nontacting human DNA with a probe which comprises at least to comprising contacting human DNA with a probe which comprises at least of contiguous nucleotides of a NORF gene whose expression varies as in M1; and (4) a method (M4) for identifying a candidate drug as a member of a nore contiguous an ember of a nore contiguous and 
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         class of drugs having a characteristic effect on gene expression in a yeast cell comprising contacting a yeast cell with a candidate drug and yeast cell comprising contacting a yeast cell with a candidate drug and monitoring expression in the yeast cell of at least 1 NORF gene whose expressed genes may be used to study, monitor and affect phases of the cell cycle, the differentially methods may be used to identify candidate drugs which affect the cell cycle and for identification of antifungal drugs. AAF33268 to AAF44064 represent SAGE tags used in the exemplification of the present invention. AAF33262 to AAF33267 represent linkers and PCR primers used in the SAGE method, in the exemplification of the present invention.
                                                                                                                                                                                                                                                                                                                                                                                      Yeast gene coding sequences comprising NORF genes with serial analysis of gene expression (SAGE) tags, useful for studying, monitoring and affecting phases of the cell cycle.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Sequence 10 BP; 1 A; 2 C; 1 G; 6 T; 0 U; 0 Other;

The present invention describes an isolated DNA molecule comprising a coding sequence of a yeast gene selected from a group of 745 NORF (not previously assigned open reading frame; or nonannotated ORF) genes comprising a SAGE (serial analysis of gene expression) tag. Also comprising a SAGE (serial analysis of gene expression) tag. Also comprising a described are: (1) a method (M.) of using NORF genes to affect the cell cycle comprising admistering a NORF gene whose expression or aries by at cycle comprising any two phases of the cell cycle selected from log phase, S phase and 62/M; (3) a method (M2) for screening candidate antifungal drug; (3) a mesthod (M2) for cell; and (b) monitoring expression of a NORF gene whose expression of the yeast gene is a candidate antifungal drug; (3) a method (M3) for identifying human genes which are involved in cell cycle progression comprising contecting human DNA with a probe which comprises at least 10 contriguous nucleotides of a NORF gene whose expression in a class of drugs and chuse sof drugs are member of a class of drugs having a characteristic effect on gene expression in a class of drugs. The NORF gene whose contitoring expression in the yeast cell of at least 1 NORF gene whose control comprising contecting a yeast cell of at least 1 cycle, the differentially expression is affected by the class of the cell cycle of cycle and for identify candidate drugs which affect the cell cycle are and for identify candidate drugs. The NORF genes may be used to identify candidate drugs which affect the cell cycle are cycle and for identify candidate drugs. The NORF genes may be used to identify candidate drugs. Yeast gene coding sequences comprising NORF genes with serial analysis of gene expression (SAGE) tags, useful for studying, monitoring and affecting phases of the cell cycle.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         The present invention describes an isolated DNA molecule comprising a coding sequence of a yeast gene selected from a group of 745 NORF (not previously assigned open reading frame; or nonannotated ORF) genes comprising a SAGE (serial analysis of gene expression) tag. Also described are: (1) a method (M1) of using NORF genes to affect the cell cycle comprising administering a NORF gene whose expression varies by at least 10% between any two phases of the cell cycle selected from log phase, S phase and G2/M; (2) a method (M2) for screening candidate antitungal drugs comprising: (a) contacting a test substance with a yeast cell; and (b) monitoring expression of a NORF gene whose expression of varies as in M1, where a test substance which modifies the expression of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         the yeast gene is a candidate antifungal drug; (3) a method (M3) for identifying human genes which are involved in cell cycle progression comprising contacting human DNA with a probe which comprises at least 10 contiguous nucleotides of a NORF gene whose expression varies at 10 and (4) a method (M4) for identifying a candidate drug as a member of a class of drugs having a characteristic effect on gene expression in a yeast cell comprising contacting a yeast cell with a candidate drug and monitoring expression in the yeast cell of at least 1 NORF gene whose expression is affected by the class of drugs. The NORF genes may be used to study, monitor and affect phases of the cell cycle, the differentially expressed genes may be used as markers of phases of the cell cycle. The methods may be used to identify candidate drugs which affect the cell cycle and for identification of antifungal drugs which affect the cell cycle are represent SAGE tags used in the exemplification of the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         : SAGE tags used in the exemplification of the present invention to AAF31267 represent linkers and PCR primers used in the SAGE
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Yeast; Saccharomyces cerevisiae; characterisation; cell cycle; NORF;

The present interaction describes an isolated DAM MINIOTE Conding sequence of a yeast gene selected from a group of 745 NORF (not previously assigned open reading frame; or nonannotated ORF) genes comprising a SAGE (serial analysis of gene expression) tag. Also described are: (1) a method (M1) of using NORF genes to affect the cell cycle comprising administering a NORF gene whose expression varies by at least 10% between any two phases of the cell cycle selected from log phase, 5 phase and G2/M; (2) a method (M2) for screening candidate antifungal drugs comprising expression of a NORF gene whose expression of cell; and (b) monitoring expression of the yeast gene is a candidate antifungal drug; (3) a method (M3) for identifying human genes which are involved in cell cycle progression of the yeast gene is a candidate antifungal drug; (3) a method (M3) for identifying human DNA with a probe which comprises at least 10 comprising contacting whose expression varies as in M1; a method (M4) for identifying a candidate drug as a member of a class of drugs having a characteristic effect on gene expression in a yeast cell comprising contacting a yeast cell with a candidate drug and yeast cell comprising contacting a yeast cell with a candidate drug and contacting a yeast cell with a candidate drug and expression in the yeast cell with a candidate drug and contacting a yeast cell with a candidate drug and contacting a yeast cell with a candidate drug and contacting a yeast cell with a candidate drug and contacting a yeast cell with a candidate drug and contacting a yeast cell with a candidate drug and contacting a yeast cell with a candidate drug and yeast cell comprises of the class of the coll cycle and for identification of partification of passes of the cell cycle and for identification of antifungal drugs which affect the cell cycle and for identification of antifuncas and year to expressed in the exemplification of the present invention.

```
The present invention describes an isolated DNA molecule comprising a coding sequence of a yeast gene selected from a group of 745 NORF (not previously assigned open reading frame; or nonamnotated ORF) genes as a selected from a group of 745 NORF (not previously assigned open reading frame; or nonamnotated ORF) genes comprising a SAGE (serial analysis of gene expression) tag. Also described are: (1) a method (M1) of using NORF genes to affect the cell cycle comprising administering a NORF gene whose expression varies by at cortifungal drugs comprising; (a) contacting a test substance with a yeast antifungal drugs comprising; (a) contacting a test substance with a yeast cell; and (b) monitoring expression of a NORF gene whose expression of the yeast gene is a candidate antifungal drug; (3) a method (M3) for the yeast gene is a candidate antifungal drug; (3) a method (M3) for identifying human genes which are involved in cell cycle progression contiguous nucleotides of are intensive and intelligent and account of a NORF gene whose expression varies as in M1; and (4) a method (M4) for identifying a candidate drug as a member of a class of drugs having a characteristic effect on gene expression in a contracting a yeast cell with a candidate drug and cypeast cell comprising contacting a yeast cell with a candidate drug and cypeast in affected by the class of drugs. The NORF genes may be used as markers of the cell cycle, the differentially couted may be used to identify candidate drugs. The NORF genes may be used to identify candidate drugs. The NORF genes may be used to identify candidate drugs. The NORF genes may be used to identify candidate drugs. The NORF genes may be used to identify candidate drugs which affect the cell cycle and for identify candidate drugs. The NORF genes may be used to identify candidate drugs which affect the cell cycle and for identify candidate drugs which cycle the defined may be used to identify candidate drugs when the cell cycle and expression of an intervent invention in the assemb
Yeast gene coding sequences comprising NORF genes with serial analysis of gene expression (SAGE) tags, useful for studying, monitoring and affecting phases of the cell cycle.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Score 8.4; DB 1; Length 10; Pred. The present invention describes an isolated DNA molecule comprising a coding sequence of a yeast gene selected from a group of 745 NORF (not previously assigned open reading frame; or nonamnotated ORF) genes comprising a SAGE (serial analysis of gene expression) tag. Also comprising a SAGE (serial analysis of gene expression) tag. Also certificated are: (1) a method (M1) of using NORF genes to affect the cell cycle comprising administering a NORF gene whose expression or aries by at cycle comprising administering a NORF gene whose expression or phase, S phase and G2/M; (2) a method (M2) for screening candidate or antifungal drugs comprising: (a) contacting a test substance which modifies the expression of comprising contacting expression of a NORF gene whose expression of the yeast gene is a candidate antifungal drug; (3) a method (M3) for identifying human genes which are involved in cell cycle progression comprising contacting human DNA with a probe which comprises at least 10 comprising contacting human DNA with a probe which comprises at least 10 contiguous nucleotides of a NORF gene whose expression in a class of drugs having a yeast cell with a candidate drug as a member of a class of drugs having a characteristic effect on gene expression in a continuous control of a class of the cell cycle the differentially expression is affected by the class of the cell cycle the differentially contacting expression in the yeast cell of at least 1 NORF gene whose expression is affected by the class of the cell cycle the differentially cycles may be used to identify candidate drugs which affect the cell cycle expression in dentification of antifungal drugs. The NORF genes may be used to identify candidate drugs which affect the cell cycle expressed genes may be used as markers of phases of the cell cycle cycle and for identification of antifungal drugs. The NORF present invention ceptores and for identify candidate drugs and provident shall not be exemplification of the present invention.

Cycle and the exemplification
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Yeast gene coding sequences comprising NORF genes with serial analysis of gene expression (SACE) tags, useful for studying, monitoring and affecting phases of the cell cycle.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                ö

```
The present invention describes an isolated DNA molecule comprising a coding sequence of a yeast gene selected from a group of 745 NORF (not previously assigned open reading frame; or nonannotated ORF) genes comprising a SAGE (serial analysis of gene expression) tag. Also described are: (1) a method (M1) of using NORF genes to affect the cell cycle comprising administering a NORF gene whose expression varies by at least 10% between any two phases of the cell cycle selected from log phase, S phase and G2/M; (2) a method (M2) for screening candidate antifungal drugs comprising: (a) contacting a test substance with a yeast cell; and (b) monitoring expression of a NORF gene whose expression of the yeast gene is a candidate antifungal drug; (3) a method (M3) for identifying human genes which are involved in cell cycle progression comprising contacting man DNA with a probe which comprises at least 10 contiguous nucleotides of a NORF gene whose expression varies as in M1; and (4) a method (M4) for identifying a candidate drug as a member of a class of drugs having a characteristic effect on gene expression in a yeast cell with a candidate drug as a member of a class of monitoring expression in the yeast cell with a candidate drug and monitoring expression in the yeast cell with a candidate drug and contacting a yeast cell with a candidate drug and possession is affected by the class of drugs. The NORF genes may be used to identify candidate drugs which affect the cell cycle and for identification of antifungal drugs. AAP33268 to AAP44064.

AAP33262 to AAP33267 represent linkers and PCR primers used in the SAGE
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Yeast gene coding sequences comprising NORF genes with serial analysis of gene expression (SAGE) tags, useful for studying, monitoring and affecting phases of the cell cycle.
Yeast; Saccharomyces cerevisiae; characterisation; cell cycle; NORF; nor previously assigned open reading frame; nonamnotated ORF; SAGE; sacial analysis of gene expression; antifungal; tag; identification; linker; PCR primer; ds.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Score 8.4; DB 1; Length 10;

The present invention describes an isolated DNA molecule comprising a coding sequence of a yeast gene selected from a group of 745 NORF (not previously assigned open reading frame; or nonamnotated ORP) genes comprising a SAGE (serial analysis of gene expression) tag. Also described are: (1) a method (M1) of using NORF genes to affect the cell comprising administering a NORF gene whose expression varies by at least 10% between any two phases of the cell cycle selected from log phase, S phase and G2/M; (2) a method (M2) for screening candidate califurgal drugs comprising: (a) contacting a test substance with a yeast cell; and (b) monitoring expression of a NORF gene whose expression of the yeast gene is a candidate antifungal drug; (3) a method (M3) for identifying human genes which are involved in cell cycle progression comprising contacting human DNA with a probe which comprises as in M1; and (4) a method (M4) for identifying a candidate drug as a member of a class of drugs having a characteristic effect on gene expression in a fect and comprising contacting a yeast cell with a candidate drug and contioning expression in the yeast cell of at least 1 NORF gene whose expression is affected by the class of the cell cycle the differentially expression in the yeast cell of at least 1 NORF gene whose expression is affected by the class of the cell cycle the differentially expression in the yeast cell of at least 1 NORF gene whose expression is affected by the class of the cell cycle the cell cycle or prevention expressed genes may be used as markers of phases of the cell cycle or prevention.

Cycle and for identify candidate drugs which affect the cell cycle or dentification of antifungal drugs. April 266 cycle and for identify candidate drugs and profice the present invention cycle and for identify candidate drugs and profice profice or dentification of antifundation of the present invention.

Example; Page 204; 419pp; English.

Yeast gene coding sequences comprising NORF genes with serial analysis of gene expression (SAGE) tags, useful for studying, monitoring and affecting phases of the cell cycle.

Example; Page 228; 419pp; English.

The present invention describes an isolated DNA molecule comprising a coding sequence of a yeast gene selected from a group of 745 NORF (not previously assigned open reading frame; or nonmoncated ORF) genes comprising a sasigned open reading frame; or nonmoncated ORF) genes comprising a shall searial analysis of gene expression) tag. Also described are: (1) a method (M1) of using NORF genes whose expression varies by at clast 10% between any two phases of the cell cycle selected from log phase, S phase and G2/M; (2) a method (M2) for screening candidate antifungal drug; (a) contacting a test substance with a yeast cell; and (b) monitoring expression of a NORF gene whose expression of the yeast gene is a candidate antifungal drug; (3) a method (M3) for the yeast gene is a candidate antifungal drug; (3) a method (M3) for identifying human genes which are involved in cell cycle progression of comprising contacting human DNA with a probe which comprises at least 10 contagous nucleotides of a NORF gene whose expression varies as in M1; and (4) a method (M4) for identifying a candidate drug as member of a class of drugs having a characteristic effect on gene expression in a flected by the class of the cell with a candidate drug and monitoring expression in the yeast cell with a candidate drug as member of expression is affected by the class of the cell cycle, the differentially expressed genes may be used to identify candidate drugs which affect the cell cycle. The methods may be used to identify candidate drugs which affect the cell cycle. The methods may be used to identify candidate drugs which affect the cell cycle and for identification of antifungal drugs. AAF33268 to AAF41064 cycle and for identification of antifungal drugs. ```

```
The present invention describes an isolated DNA molecule comprising a coding sequence of a yeast gene selected from a group of 745 NORF (not previously assigned open reading frame; or nonannotated ORF) genes comprising a SAGE (serial analysis of gene expression) tag. Also described are: (1) a method (M1) of using NORF gene whose expression varies by at cycle comprising administering a NORF gene whose expression varies by at phase, 5 phase and G2/M; (2) a method (M2) for screening candidate antifungal drugs comprising (a) contacting a test substance with a yeast call; and (b) monitoring expression of a NORF gene whose expression of the yeast gene is a candidate antifungal drug; (3) a method (M3) for identifying human genes which are involved in cell cycle progression comprising contacting human DNA with a probe which comprises at least 10 contiguous nucleotides of a NORF gene whose expression varies as in M1; contiguous nucleotides of a NORF gene whose expression varies as in M2; and (4) a method (M4) for identifying a candidate drug as a member of a class of drugs having a characteriatic effect on gene expression in a
                                                                                                                                                                                                                                                       ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Yeast gene coding sequences comprising NORF genes with serial analysis of gene expression (SAGE) tags, useful for studying, monitoring and affecting phases of the cell cycle.
to study, monitor and affect phases of the cell cycle, the differentially expressed genes may be used as markers of phases of the cell cycle. The methods may be used to identify candidate drugs which affect the cell cycle and for identification of antifungal drugs. AAF33268 to AAF44064 represent SAGE tags used in the exemplification of the present invention. AAF33262 to AAF33267 represent linkers and PCR primers used in the SAGE method, in the exemplification of the present invention
                                                                                                                                                                                                                                                       Gaps

yeast cell comprising contacting a yeast cell with a candidate drug and monitoring expression in the yeast cell of at least 1 NORF gene whose expression is affected by the class of drugs. The NORF genes may be used to study, monitor and affect phases of the cell cycle, the differentially expressed genes may be used as markers of phases of the cell cycle. The methods may be used to identify candidate drugs which affect the cell cycle and for identification of antifungal drugs. AAF33268 to AAF4064 represent linkers and PCR primers used in the SAGE method, in the exemplification of the present invention.

Yeast gene coding sequences comprising NORF genes with serial analysis of gene expression (SAGE) tags, useful for studying, monitoring and affecting phases of the cell cycle.

Example; Page 69; 419pp; English

The present invention describes an isolated DNA molecule comprising a coding sequence of a yeast gene selected from a group of 745 NORF (not previously assigned open reading frame; or nonannotated ORF) genes comprising a SAGE (serial analysis of gene expression) tag. Also described are: (1) a method (M1) of using NORF genes to affect the cell cycle comprising administering a NORF gene whose expression varies by at least 10% between any two phases of the cell cycle selected from log phase, S phase and GZ/M; (2) a method (M2) for screening candidate antifungal drugs comprising: (a) contacting a test substance with a yeast cell; and (b) monitoring expression of a NORF gene whose expression varies as in M1, where a test substance which modifies the expression the yeast gene is a candidate antifungal drug; (3) a method (M3) for identifying human genes which are involved in cell cycle progression comprising contacting human DNA with a probe which comprises at least 10 AAP35215

Yeast gene coding sequences comprising NORF genes with serial analysis of gene expression (SAGE) tags, useful for studying, monitoring and affecting phases of the cell cycle.

Example; Page 111; 419pp; English.

The present invention describes an isolated DNA molecule comprising a coding sequence of a yeat gene selected from a group of 745 NORF (not previously assigned open reading frame; or nonamotated ORF) genes comprising a SAGE (serial analysis of gene expression) tag. Also described are: (1) a method (MI) of using NORF genes to affect the cell escribed are: (2) a method (MI) of using NORF genes to affect the cell least 10% between any two phases of the cell cycle selected from log phase, S phase and G2/M; (2) a method (M2) for screening candidate antifungal drugs comprising: (a) contacting a test substance with a yeast cell; and (b) monitoring expression of a NORF gene whose expression of

the yeast gene is a candidate antifungal drug; (3) a method (M3) for identifying human genes which are involved in cell cycle progression comprising contacting human DNA with a probe which comprises at least 10 contiguous mucleotides of a NORF gene whose expression varies as in M1; and (4) a method (M4) for identifying a candidate drug as a member of a class of drugs having a characteristic effect on gene expression in a cyeast cell comprising contacting a yeast cell with a candidate drug and monitoring expression in the yeast cell of at least 1 NORF gene whose expression is affected by the class of the cell cycle, the differentially corpressed genes may be used as markers of phases of the cell cycle. The methods may be used to identify candidate drugs which affect the cell cycle and for identification of antifungal drugs. AAP33268 to AAF44064 represent SAGE tags used in the exemplification of the present invention.

AAF33262 to AAF33267 represent linkers and PCR primers used in the SAGE method, in the exemplification of the present invention.

New genetic variants of the human polypeptide 1 (CYP27B1) gene, useful for treating disorders associated with aberrant expression or overproduction of TNF e.g. cancer, diabetes or inflammatory disorders.

Claim 16; Page 15; 64pp; English

The invention discloses an isolated polymorphic polynucleotide comprising a coding sequence for a cytochrome P450, subfamily XXVIIB (25-hydroxyvitamin D-1-alpha-hydroxylase) or CYP27B1 isogene. CYP27B1

calcitriol (lalpha,25 (GH)2D3) in the proximal tubule of the kidney. The calcitriol (lalpha,25 (GH)2D3) in the proximal tubule of the kidney. The binding of calcitriol to the nuclear receptor for the hormonally active form of vitamin D (UNR) activates the receptor with subsequent regulation of physiological events such as calcium homeostasis and cellular of physiological The various polymorphisms in the CYP2TB1 gene may cause pseudovitamin D-dependent rickets type I. The polymorphism gene may cause for haplotyping, genotyping, predicting a haplotype pair, identifying an association between a trait and at least one haplotype pair, identifying an casociation between a trait and at least one haplotype or haplotype pair association between a trait and at least one haplotype or haplotype pair association between a trait and at least one haplotype or haplotype pair association perween a trait and at least one haplotype or haplotype pair and for association perween a trait and at least one haplotype or haplotype pair and for specific for, and immunoractive with, the isolated polypeptide and for specific for, and immunoractive with, the isolated polypeptide and for composition, comprising the isolated polypeptide. The pharmaceutical composition, comprising the isolated polypucleotide, an antisense of oligonucleotide encoding the antisense oligonucleotide encoding the antisense oligonucleotide or another compound that inhibits expression of the CYP27B1 isogene, is useful for treating cancer, diabetes or inflammantory disorders in the sequences presented in ABS64898-ABS64911 are the primer-extension oligonucleotide primers which were used for detecting CYP27B1 gene polymorphisms. The CYP27B1 gene is catalyses the hydroxylation of 25-hydroxyvitamin D3 [25(OH)D3] to

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The present invention describes a human maturation/activation dendritic cell (DC) expression gene group consisting of 100 genes which show the highest expression among the genes expressed in human maturation/activation DC. Also described are: (1) a protein expressed by the above human maturation/activation DC expression gene; (2) an antibody against the protein, and (3) an antagonist against the expression of each gene belonging to the above gene group. The gene group is useful for the treatment and the diagnosis of various human diseases related to human
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Gaps

The invention describes an isolated polymucleotide, which comprises genes and haplotypes of the small inducible cytokine subfamily A (Cys-Cys), member 20 (SCYA20) gene. The polymucleotide comprises polymorphic sites referred to as PS1-9 to designate the order in which they are located in the gene. The polymorphisms and haplotypes of SCYA20 gene are useful for validating whether SCYA20 is a suitable target for drugs to treat psoriasis and disorders associated with its abnormal expression or tunction, screening for such drugs and reducing bias in clinical trials of such drugs. Haplotype information would be useful in improving the CFfficienty and output of several steps in the drug discovery and development process, including target validation, identifying lead compounds, early phase clinical trials. The methods are useful in screening for compounds targeting SCYA20 to treat a specific condition or disease predicted to be associated with SCYA20 activity, e.g. psoriasis. This sequence represents a primer extension oligonucleotide used to identify polymorphisms in the SCYA20 gene
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      New genetic variants comprising haplotypes of the small inducible cytokine subfamily A, member 20 (SCYA20) gene, useful in improving the efficiency drug screening protocols for compounds (e.g. antipsoriatic drug) targeting SCYA20.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Gaps
                                                                           Small inducible cytokine subfamily A (Cys-Cys) member 20; SCYA20; polymorphism; haplotype; psoriasis; gene expression; primer extension oligonucleotide; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Human; glutamate receptor metabotropic 8; GRM8; receptor;

Genetic variants of Glutamate Receptor, Metabotropic 8 isogenes, useful for improving efficiency and reliability in drug development for treating neuropathological conditions and retinitis pigmentosa.

Claim 17; Page 15; 110pp; English

The invention relates to a method for haplotyping the glutamate receptor, metabotropic 8 (GRM8) gene (ABO72798, ABO72905) of an individual, and also describes 21 novel polymorphic sites within the human GRM8 gene. The CRM8 gene is located on chromosome 7431.3-32.1 and contains 10 exons which encode a 908 amino acid protein (ABB09564). GRM8 is involved in cylutamate mediated neurotransmission, being a member of a subfamily of metabotropic glutamate receptors that inhibit the activity of adenylate concentrate accompanies of the GRM8 gene encompasses regions linked to Smith-Lemli-Opitz syndrome and a form of retinitis pigmentosa. GRM8 nucleic acid sequences are useful in studying the expression and function of GRM8, and in expressing GRM8 protein for use in screening drugs for the treatment of GRM8. The confine of GRM8 is nucleic acid sequences are also useful in studying the effect of polymorphisms on the biological activity of GRM8. Polymorphisms in the target region may be determined by the use of allele-specific oligonuclectides (ASOS; ABO72800-ABO72800-ABO72800-ABO72803-ABO72800-ABO compounds for treating GRMB-associated conditions Sequences ABQ72863-ABQ72904 represent sequences laimed as components of primers used to detect transgemic animals comprising a human GRMB gene are useful for studying the expression of GRMB isogenes in vivo, for in vivo screening and the expression of GRMS isogenes in vivo, for in vivo screening and testing of drugs targeted to GRMS, and for testing the efficacy of

uncleic acid and protein sequences. Specifically, the invention relates to the discovery of 22 novel polymorphic sites within the APC2 gene. The to the discovery of 22 novel polymorphic sites within the APC2 gene. The control also comprises methods for haplotyping and genotyping the ACP2 gene invention also comprises methods for haplotyping and genotyping the ACP2 gene invention also comprises methods for haplotyping the ACP2 gene of lysosomal-specific enzyme that catalyses the hydrolysis of orthophosphoric monoesters to alcohol and phosphate. The ACP2 gene and protein are pharmaccutically important in the treatment of Hodgkin's cliease (HD) and acid phosphatase deficiency. The novel ACP2 gene and polymorphisms of the invention are useful in haplotyping the ACP2 gene. CC polymorphisms of the invention are useful in validating ACP2 as a target (and designing drugs) for treating an ACP2-related disease or condition (e.g. Hodgkin's disease and acid phosphatase deficiency). The ACP2 gene polymorphisms are useful in the production of a transgenic animal which expresses ACP2 protein. The ACP2 protein and nucleic acids of the invention are useful in the production of a transgenic animal which expresses ACP2 protein. The ACP2 mucleic acids of the invention are useful in the production of allele-specific oligomucleotides designed to represent claimed ACP2 polymorphisms. Nucleic acids ABL362320 crepresent claimed ACP2 pallele-specific probes, Nucleic acids acids ABL36231 and acids acid Novel genetic variants of acid phosphatase 2, lysosomal polypeptide gene useful in studying expression and function of the protein, and for screening drugs to treat diseases e.g. Hodgkin's disease. lysosome-specific enzyme; orthophosphoric monoester hydrolysis; Hodgkin's disease; HD; acid phosphatase deficiency; novel polymorphic site; ACP2 haplotype; ACP2 genotype; polymorphism; transgenic animal; primer; probe; primer-extension oligonucleotide; SNP; single nucleotide polymorphism. Human lysosomal acid phosphatase 2 primer-extension oligonucleotide 18 The invention comprises the human lysosomal acid phosphatase 2 (ACP2) acid phosphatase 2; ACP2; gene; chromosome 11; ABL36364 represent claimed ACP2 allele-specific PCR primers. Nu acids ABL36365-ABL36408 represent claimed ACP2 primer-extension .; 0 DB 1; Length 10; 1; Indels Sequence 10 BP; 0 A; 3 C; 1 G; 6 T; 0 U; 0 Other; Similarity 90.0%; Score 8.4; DE Similarity 90.0%; Pred. cardiant; vasotropic;

```
This invention relates to a novel dominant negative or constitutively excitive mutant sequence of the cardiac-associated Myo/VI protein (MP). The invention may be useful for the development of compounds with a cardiant, vasotropic, immunosuppressive or vulnerary activity through the inhibition of formation of Norkappas p55 homodimers. The invention may be useful for the development of treatments for invention may be useful for the development of treatments for cardiovascular disease including cardiac hypertrophy, myocardial
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          infarction, ischaemia/reperfusion injury and heart transplantation, in a mammal, for anti-ageing treatment, for inhibiting formation of NFkappaB p50 homodimers or NFkappaB p55 homodimers in a cell of a mammal and for reducing formation of NFkappaB p65 homodimers in a cell of a mammal.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Novel dominant negative mutant sequence or constitutively active mutant sequence of Myo/V1 polypeptide, useful for treating cardiovascular disorders and inhibiting formation of NFkappaB homodimers.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Colorectal cancer; colorectal adenoma; ss; human; renal dipeptidase; macrophage inhibitory cytokine; MIC; RDP; faeces; blood; kidney proximal tubule.

The invention relates to detecting CC (colorectal cancer e.g. colorectal adenoma), comprising: (a) detecting macrophage inhibitory cytokine (MIC) or renal dispeptidase (RIPP) in faeces or blood of a subject and comparing amount of MIC or RDP detected to that in normal subjects, where an elevated amount of MIC or RDP in the subject is an indicator of CC in subject; (b) isolating mRNA sample from faeces of a subject, detecting MIC or RDP mRNA in the mRNA sample from for comparing amount of MIC or RDP cor RDP mRNA in the subject is an indicator of CC in subject; (c) amount of MIC or RDP mRNA in the mRNA sample, and comparing the amount of MIC or RDP mRNA in the mRNA sample, and comparing the amount of MIC or RDP mRNA in the mRNA sample, and comparing the amount of MIC or RDP mRNA in normal subjects, where can elevated amount of MIC or RDP mRNA in normal subjects, with cor RDP mRNA in normal subjects, with an elevated amount of CC in the BRNA sample is an indicative of CC in the subject; (d) contacting blood or faeces of a subject or detection of increased reaction product or decreased RDP substrate, and electing the amount of activity of RDP in the blood or faeces of the subject and comparing the amount of activity of RDP in blood or faeces of the subject and comparing the moiety, where an elevated amount of activity of RDP in the blood or faeces of the subject is an indicator of CC in the subject, where an elevated amount of activity of RDP, where the antibody which specifically contacting the moiety which subject from outside of the subject and detecting the moiety which subject is an indicator of CC in the proximal tubules of the kidney identifies CC; or (f) administering to a subject as unbetrate for RDP, the subject or MCC and antible detectable moiety, isolating faeces or blood from the subject, and detectable moiety, isolating faeces or blood from the subject, or the detectable moiety, where increased product or detereable con the moiety where increased products or detereable con the moiety where increased 
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               with the detectable moiety, where increased product or decreased substrate in the faeces or blood indicates CC in the subject. The methods are useful for detecting colorectal cancer in a subject. The present
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  transcript whose expression is
                                                                                                                                                                                                                                                                                                                                                                                             Detecting colorectal cancer in a subject, involves detecting macrophage inhibitory cytokine or renal dipeptidase or their mRNA in feces or blood
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Gape

The present invention describes a library comprising polypeptides. Each polypeptide are identical to a zinc finger domain. The domains of each polypeptide are identical to a zinc finger domain from a naturally occurring protein and either do not occur in the same naturally occurring protein or occur in the same naturally occurring protein or occur in the same naturally occurring protein in the polypeptide. The domains vary among oblypeptides. Also described: (1) producing chimeric nucleic acids; (2) generating an artificial zinc finger polypeptide that specifically binds to a target DNA site; and (3) identifying a nucleic acid encoding a zinc finger polypeptide that specifically recognises a target DNA site. The library can be used for producing chimeric nucleic acids. ACC41551 to ACC41558 and ABR40919 to ABR41015 represent nucleotide and amino acid sequences given in the exemplification of the present invention
                                                                                                                                                                                                                                                                                                                                                                                                               New library comprising polypeptides having zinc finger domains, useful for producing chimeric nucleic acids.
                                           Zinc finger protein DNA-binding domain target sequence SEQ ID NO:256

New nucleic acid sequences of the optineurin gene are useful to detect polymorphisms particularly single nucleotide polymorphisms in the optineurin promoter to diagnose, prognose and treat glaucoma and related
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Human, optineurin; ds; ophthalmological; single nucleotide polymorphism; SNP; glaucoma; progressive ocular hypertensive disorder; glaucoma related disorder; motif; repeat element; regulatory region.
                                                                                                                                                                                                                             The invention relates to an isolated androgen-regulated gene (ARG) designated as PMEPAl. The invention is useful for selecting primers and probes for detecting prostate cancer cells in a biological sample by using nucleic acid amplification techniques. The present sequence is
                                                                                                                                            Novel isolated androgen-regulated gene designated as PMEPAl useful for selecting primers and probes for detecting prostate cancer cells in biological samples by nucleic acid amplification techniques.

least 20 but not more than 1500 consecutive nucleotides of the optineurin promoter appearing as ADE13890. Also included are the optineurin promoter operably linked to a heterologous nucleic acid, a nucleic acid capable of detecting a single nucleotide polymorphism (SNP) in the optineurin promoter. Promoter, a host cell comprising the premoter operably linked to a heterologous sequence, diagnoshing or prognosing glaucoma in a sample obtained from a cell or bodily fluid (comprising detecting a polymorphism or in a promoter region of the optineurin gene, associated with a glaucoma in a sample containing the presence of an optineurin gene sequence variation in a sample containing of the aperage of an optineurin promoter sequence variation in a sample containing the presence or increased containing in a sample containing the presence or increased containing in a patient, comprising providing containing the variation within the optineurin promoter amplification reaction primers that direct amplification of a selected mucleic acid region containing the variation within the optineurin promoter and amplifying the DNA) and detecting a polymorphism (comprising cobtaining a sample containing human genomic DNA, providing a nucleic acid capable of detecting a SNP located within an optineurin promoter, and containing the presence of anoptineurin promoter, and detecting a SNP located within an optineurin promoter, and containing the presence of anoptineurin promoter, and containing the presence of anoptineurin promoter, and amplifying the DNA) and detecting a polymorphism of a proper promoter and anoptineurin promoter and anoptineurin promoter, and anoptineurin promoter, and anoptineurin promoter and anoptineurin p
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               human; cholesteryl ester transfer protein; CETP;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The present invention provides novel genetic variants of human tumour necrosis factor receptor superfamily, member 1A (TNFRSF1A) gene. The invention also relates to compositions and methods for haplotyping and/or genotyping TNFRSF1A gene in an individual. Methods and compositions of the invention are used to screen drugs targetting the TNFRSF1A protein to treat a condition or disease predicted to be associated with TNFRSF1A activity. The disease or condition include tumours, inflammatory disorders or immunological disorders. The invention is also useful in gene therapy. The present sequence is a primer used to detect human TNFRSF1A gene polymorphisms.
                             The invention comprises the amino acid and coding sequences of the human cholesteryl ester transfer protein (CETP), the invention also comprises bolymorphisms identified within the CETP gene. The DNA and protein sequences of the invention are useful in haplotyping and/or genotyping the CETP gene in an individual. The DNA and protein sequences may also be used to screen drugs or compounds targeting the CETP or its variant to treat a condition or disease associated with CETP (e.g. atherosclerosis, cardiovascular disease or hypercholesterolaemia). The present DNA sequence represents an allele specific extension PCR primer for the human

The invention describes a personal care method of detecting photodamage comprising comparative Serial Analysis of Gene Expression (SAGE) of sundamaged pre-auricular skin and sun-protected post-auricular skin as well as sun-protected epidermis. The method involces: using at least one marker of photodamage comprising one of 15 fully defined sequences (S1-15) as given in the specification, and detecting a change in the marker to determine the presence of photodamage. The method is useful for detecting photodamage, aging, dry skin or oily skin. This sequence represents a SAGE sequence tag used as a marker for detecting photodamage.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             personal care method; photodamage; Serial Analysis of Gene Expression; SAGE; sun-damage; pre-auricular skin; sun-protected post-auricular; sun-protected epidermis; aging; dry skin; oily skin; photodamage marker;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The present invention relates to the identification and characterisation of a novel androgen-regulated genes (ARGS) that exhibits abundant expression in prostate tissue. The novel gene is designated PMEPA1. The invention is useful for diagnosing and prognosing prostate cancer. The invention is also useful in hormonal therapy. The present sequence is
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Gaps

                                                                                                                                                                                                                                                                                                                                                                                                                                                             ઢ
                                                                                                                                                                                                                                                                                                                                                                                         The invention describes a personal care method of detecting photodamage comprising comparative Serial Analysis of Gene Expression (SAGE) of sundamaged pre-auricular skin and sun-protected post-auricular skin as well as sun-protected post-auricular skin as well as sun-protected epidermis. The method involces: using at least one marker of photodamage comprising one of 15 fully defined sequences (S1-15) as given in the specification; and detecting a change in the marker to determine the presence of photodamage. The method is useful for detecting photodamage, aging, dry skin or oily skin. This sequence represents a SAGE sequence tag used as a marker for detecting photodamage
                                                                                                                                                                                                                                                      Personal care method for detecting photodamage, aging, dry or oily skin comprises detecting gene markers upregulated in pre-auricular skin.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The invention relates a method to the detection of photodamage comprising using a marker of photodamage and detecting a change in the marker to determine the presence of photodamage. The marker is a nucleic acid having cDNA sequence of 11 or 10 base pairs. Detection is done by comparing a first skin sample with a second skin sample to determine a change in a marker. The method is used for detecting a skin condition, e.g. photodamage, aging and drying. The method provides an easy way to track expression of even small numbers of genes in laboratory models or in human tissue. The present sequence represents a photodamage marker
                                                                                                                                               represents a SAGE sequence tag used as a marker for detecting photodamage
comprising comparative Serial Analysis of Gene Expression (SAGE) of sundamaged pre-auricular skin and sun-protected post-auricular skin as well as sun-protected epidermis. The method involces: using at least one marker of photodamage comprising one of 15 fully defined sequences (S1-15) as given in the specification; and detecting a change in the marker to determine the presence of photodamage. The method is useful for detecting photodamage, aging, dry skin or oily skin. This sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Detection of skin conditions e.g. photodamage, aging and drying, comprises using polynucleotide sequences in gene arrays as markers, and detecting a change in the markers.
                                                                                                                                                                                                                                                                                           Gaps

The invention relates a method to the detection of photodamage comprising using a marker of photodamage and detecting a change in the marker to determine the presence of photodamage. The marker is a nucleic acid having cDNA sequence of 11 or 10 base pairs. Detection is done by comparing a first skin sample with a second skin sample to determine a change in a marker. The method is used for detecting a skin condition, eg. photodamage, aging and drying. The method provides an easy way to track expression of even small numbers of genes in laboratory models or in human tissue. The present sequence represents a photodamage marker
                                                                                                                                                                                                                                                                                                                                                                                          Detection of skin conditions e.g. photodamage, aging and drying, comprises using polynucleotide sequences in gene arrays as markers, and detecting a change in the markers.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Sequence 10 BP; 7 A; 1 C; 2 G; 0 T; 0 U; 0 Other;

The invention relates a method to the detection of photodamage comprising using a marker of photodamage and detecting a change in the marker to determine the presence of photodamage. The marker is a nucleic acid having cDNA sequence of 11 or 10 base pairs. Detection is done by comparing a first skin sample with a second skin sample to determine a change in a marker. The method is used for detecting a skin condition, e.g. photodamage, aging and drying. The method provides an easy way to track expression of even small numbers of genes in laboratory models or in human tissue. The present sequence represents a photodamage marker used in the method of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  nucleus; transcription; gene expression; retinoblastoma-1; RB1CC1;
                                                                                                                                                                                            Detection of skin conditions e.g. photodamage, aging and drying, comprises using polymucleotide sequences in gene arrays as markers, and detecting a change in the markers.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Gaps

                                                                                                           The invention relates to a protein or polypeptide found in the nuclei of human and animal cells that are associated with transcription and/or induction of expression of retinoblastoma-1 gene (RBICCI). The detection of RBICCI gene and its protein is useful for the diagnosis of cancer. The human RBICCI cohe is containing a 4782 bp ORP, encoding a 180 kD 1594 amino acid protein. This sequence corresponds to the sequence at the junction between an intron and an exon in the human RBICCI genomic
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Bstimating melting temperature, for designing or selecting oligonucleotide probes or primers, comprises modifying the reference melting temperature by a logarithm of the ratio of the desired ion to the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        The present invention relates to a method for estimating a melting temperature (Tm) for a polynucleotide at a desired ion concentration having a known G-C content value. The method is useful designing and selecting oligonucleotide probes and primers. The present sequence was used to illustrate the method of the invention.
                                                                                                                                                                                                                                                                                                                                   Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Oligo SEQ ID 83, used in method for estimating melting temperature.
                               Protein in the nuclei of human and animal cells associated with expression of retinoblastoma-1 gene for diagnosis of cancer.

The oligonucleotides AAQ96015-42 are oligomers contg. a specific region which is complementary to the target sequence and a non-specific region at one or both ends of the specific region. The non-specific region is composed of bases having a non-standard base e.g. hypoxanthine, which is capable of loose pairing with standard base e.g. hypoxanthine, which is pref. attached to a solid support by an aminolink 2 at the 5' end. The oligomers AAQ96028-42 are targeted to the target DNA sample AAQ96027. The oligomucleotides are useful for the diagnosis of infectious or hereditary diseases and in genome mapping. The oligomucleotides increase the sensitivity of hybridistation because the presence of completely complementary hybrids can be distinguished from mismatched hybrids (D value as high as 24 can be achieved)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  An oligo:nucleotide with a degenerate non-standard base hybridises with a target sequence in a sample oligo:nucleotide, for improved discrimination of mismatched hybrids.

The invention relates to detecting tumours comprising dividing a test cample of alleles into a number of aliquots, amplifying the alleles, transcribing and translating proteins in vitro using the amplified alleles as templates, and determining size or composition of the proteins, where a difference from the protein produced by the wild-type proteins, where a difference from the protein produced by the wild-type allele indicates a mutation in the amplified allele and thus a tumour in the patient, the method is known as digital protein truncation test (Digroff PT). The gene is preferably adenomatous polyposis coli (APC), and at eaplified. The allele may be isolated from a stool sample. Alternatively the gene is VHL and the disease is von Hippel-landau, the gene is CF and the disease is cystic fibrosis, or the gene is harditary non-polyposis colorectal cancer. The invention is useful to detect cancer particularly colorectal cancer, especially adenomatous polyposis coli, von Hippel-landau or hereditary non-polyposis colorectal cancer, especially colorectal cancer, especially colorectal cancer, especially colorectal cancer, in the early stages and in samples, particularly stool campules, containing high levels of coher alleles. The assay is more cancer particularly colorectal cancer, and the colorectal cancer, and the colorectal cancer, especially cancer, especially campules, containing high levels of coher alleles. The assay is more cancer mitterion and reservance mitterions and entated allele among cancer, which type alleles. APC mittations can be identified through in vitro transcription and reservance entated entated allele among the cancer where the colorectal cancer which is a serviced to the cancer many with type alleles. APC mittations can be identified through in vitro
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Detecting tumors by protein truncation assay using a body sample that has been divided up to contain few allele templates per reaction increases sensitivity to allow early stage detection and in samples with a high number of other alleles.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          premature stop codon producing truncated proteins. The present sequence is a sequence included in the sequence listing but not mentioned anywhere else in the patent.

```
AAQ81105 is a peptide nucleic acid (PNA), which binds a target sequence. The binding of the PNA prevents the transcription of the target sequence by RNA Polymerase. The ability of the PNA to arrest transcription makes it useful in gene therapy, and in diagnostic and prophylatic methods. (Updated on 25-MAR-2003 to correct PN field.)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Peptide nucleic acid; gene therapy; transcription arrest; diagnosis;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The present invention describes the human old-15 protein, which has high homology to 3'-5' RNA exonuclease and polynucleotide phosphorylase enzymes. The human old-15 gene is located to chromosome 2, more enzymes. The human old-15 gene is located to chromosome 2, more organies. The human old-15 for 2pl6.1. Also described: () an isolated old-15 protein comprising the 781-amino acid sequence of SEQ ID NO:2 (ADRO1085); (3) a method of promoting terminal differentiation in a cell; (4) a method of promoting senescence in a cell (5) a method of reversing a transformed phenotype of a cell of the containing an old-15 promoter operatively linked to a heterologous gene of interest; (8) an assay system comprising the cell, where if the gene of interest; (8) an assay system comprising the cell, where if the gene therapy. The old-15 pas eversing a transformed phenotype of a cell or assay method. Old-15 has cytostatic activity, and can be used in gene therapy. The old-15 gene is useful in promoting terminal differentiation or sensescence in a cell, reversing a transformed phenotype of a cell or epresents a consensus interferon stimulated response element (IRES) sequence, which is used in the exemplification of the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   ö
